

Issue 11-21 E

Block Cylinders

single acting, with and without spring return max. operating pressure 500 bar

Single-acting block cylinders can be used for all hydraulically-operated linear movements that do not require a retraction force or where the piston is retracted by an external force.

- Positioning
- Clamping
- Supporting
- Locking
- Rivetina
- Moving Closing
- · Locking
- Lifting
- Pushina

Function

With spring return

When pressurising the cylinder the piston extends. After pressure relief, the piston is retracted by spring force.

The pressure spring must not only overcome the friction forces, but must also supply the hydraulic oil back to the reservoir.

Without spring return

When pressurising the cylinder the piston extends. After pressure relief, the piston must be retracted by an external force. Since no pressure spring is installed, this single-acting block cylinder has the same stroke as the double-acting version with the same length.

Material

Cylinder housing: high alloy steel,

black oxide* Kolben:

case-hardening steel, hardened and ground

O-rings and wipers:

NBR = nitrile-butadiene rubber

Temperature range: -25 up to +100 °C

FKM = fluor caoutchouc

Temperature range: -15 up to +200 °C

Glydrings and back-up rings:

PTFE = polytetrafluor ethylene Temperature range: -45 up to +200 °C

Hydraulic fluid: see data sheet A 0.100 Special versions for other hydraulic fluids and operating temperatures up to +250 °C are

available on request. auf Anfrage lieferbar. * Size 1519 black matt lacquered

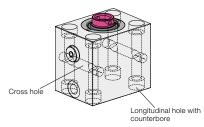

Advantages

- 8 sizes each with 2 stroke lengths available
- Large range of diameter Piston Ø 16 up to 100 mm
- Large range of stroke 8 up to 100 mm
- Large range of force 2 kN for piston Ø 16 mm and 100 bar 392 kN for piston Ø 100 mm and 500 bar
- Large retention force
- Compact block design
- Many fixing possibilities
- Many connecting possibilities
- Case-hardened piston rod
- Alternatively NBR or FKM seals and wiper Operating temperature up to 200 °C with
- FKM seals
- Minimum leakage
- Maintenance free

General tolerances as per DIN ISO 2768-mH

Important notes

The block cylinders designed for industrial applications to transform hydraulic pressure to a linear movement and /or force. They can generate very high forces. The fixture or machine must be in the position to compensate the forces.

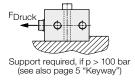

In the effective area of the clamping bolt there is the danger of crushing. The manufacturer of the fixture or the machine is obliged to provide effective protection devices.

Mounting

In principle, screws of tensile strength 8.8 can be used to secure the block cylinders.

Support

If block cylinders are fastened with screws across the cylinder axis, they must be supported for operating pressures of 100 bar and higher.

Venting of the spring area

If there is any danger that fluids penetrate through the sintered metal air filter into the spring area, a vent hose has to be connected and be placed in a protected position (see data sheet G 0.110).

Admissible dynamic load

This block cylinder line is not equipped with stroke end cushioning, i.e. a weight m fixed to the piston will move with speed v against the internal stop without braking. Above all in extending direction, the threaded bushing is overloaded and the operating safety isjeopardised.

At piston speeds higher than 0.05 m/s and a weight that exceeds the own weight of the block cylinder, a cylinder with stroke end cushioning has to be used or the cylinder movement must be effected against an external stop. This is also valid for punching applications

Side loads

Side loads cannot be compensated, since in the case of single-acting block cylinders the guide of the piston rod is not lubricated with hydraulic oil.

Accessory - Contact bolts

As accessory different contact bolts and coupling pins are available. See data sheet G 3.800

For further application instructions see data sheet A 0.100 and program summary "Block Cylinders".

Standard variants

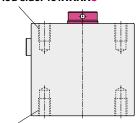

Thread • Keyway • Stroke limitation

4 threads at the front to fix the housing C, D

Instead of longitudinal holes and cross holes the block cylinders can be provided with 4 interior threads, alternatively at the rod side C or at the For pipe thread connection the position of the bottom side D.

Rod side: 151XXXXC

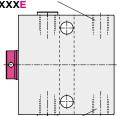

Bottom side: 151XXXXD

Keyway to support the housing E, F, Q

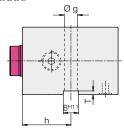

The block cylinders without longitudinal holes or interior thread can be equipped with a keyway for a key.

connecting threads have to be determined in advance (identification code E or F). For manifold-mounting connection (K or L) the identification code is Q

Pipe thread connection at the right side: 151XXXXE

Pipe thread connection at the left side: 151XXXXF

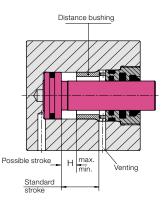

Manifold-mounting connection: 151XXXXXQ

Stroke limitation by distance bushing H

The extending piston stroke of block cylinders can be limited by installing a distance bushing. The minimum stroke should not be less than 1 mm. The maximum stroke possible based on the standard stroke is indicated in the below

Only without spring return!

Example: Possible stroke

Block cylinder 1515065 Standard stroke 50 mm

As per table:

Hmin. = 1 mm

Hmax. = 50 - 3 = 47 mm
