

YDAC INTERNATIONAL

Universal Charging and Testing Unit FPU-1 For Bladder,

Piston and Diaphragm Accumulators

1. DESCRIPTION

1.1. FUNCTION

The charging and testing unit FPU-1 is used to charge accumulators with nitrogen or to check or to change the existing pre-charge pressure in accumulators. For this purpose the charging and testing unit is screwed onto the gas valve of the hydraulic accumulator and connected to a commercial nitrogen bottle via a flexible charging hose. If the nitrogen pressure is only to be checked or reduced, the charging hose does not need to be connected. The unit has a screw-type fitting with a built-in gauge, check valve and a spindle for opening the accumulator gas valve to control the pressure.

HYDAC piston and diaphragm accumulators can be charged and checked without the need for adaptors. Bladder accumulators, however, require an adaptor (A3 supplied as standard, see model code on page 2).

The FPU-1 must only be used for its intended purpose.

FPU-1 250 F 2.5 G2 A1 K

1.2. INTERVALS BETWEEN CHECKING

On the whole, nitrogen losses on HYDAC hydraulic accumulators are very low. However, a regular check of the gas pre-charge pressure is recommended to prevent the piston from hitting the cover plate or the bladder or diaphragm from becoming too deformed, if there is a drop in the pressure po.

The pre-charge pressure po as shown on the label or the accumulator body, must be reset after every new installation or repair and then checked at least once during the following week. If no nitrogen loss is detected, a further check should be made after approx. 4 months. If after this period no change in the pressure is found, a yearly check should be sufficient.

1.3. CONSTRUCTION

The HYDAC charging and testing unit for bladder, piston and diaphragm accumulators consists of:

- Valve body
- Spindle
- Check valve
- Release valve
- Gauge
- Charging hose
- A3 adaptor for bladder accumulators

1.4. ACCESSORIES

- □ Gas safety valve with intermediate piece TUV set and lead sealed, it must be fitted between the hydraulic accumulator and the nitrogen bottle by means of the intermediate piece, if the gas pressure in the commercially available nitrogen bottle is higher than the max. permissible operating pressure of the hydraulic accumulator.
- Pressure reducer for setting the required pre-charge pressure between nitrogen bottle and
- accumulator.

 Protective case for storing the charging and testing unit and adaptors.

Different types of case are available, depending on customer requirement.

2.4. SPECIAL MODELS

For higher pressures, the following special models are available:

- ☐ FPS 600 for bladder accumulators up to 600 bar max. pre-charge pressure (see technical information 293715).
- ☐ FPK 600 for piston, diaphragm and SB800-1.5 accumulators up to 600 bar max. pre-charge pressure (see technical information 297248).
- ☐ FPH 800 for high pressure bladder accumulators up to 800 bar max. pre-charge pressure (see technical information 242948).

3. OPERATING INSTRUCTIONS

3.1. TAKING ACCOUNT OF THE TEMPERATURE EFFECT

In order that the recommended pre-charge pressures are maintained even at relatively high operating temperatures, the pre-charge pressure po charge for charging and testing a cold accumulator must be selected as follows:

 p_0 charge = p_0 Pre-charge temp. + 273 Operating temp. + 273 Pre-charge temperature [°C] Operating temperature [°C]

3.2. PREPARATION

Prior to each testing, topping-up or re-charging of nitrogen, the accumulator must be isolated from the pressurised system by means of a shut-off valve and the fluid released.

Unscrew the protective caps S and H (only on bladder accumulators). Remove the O-ring O on bladder accumulators. Slightly loosen the internal hexagon screw P on piston and diaphragm accumulators by means of an Allen key SW 6, DIN 911 (approx. ½ turn). Place FPU-1 onto the accumulator and screw connector D by hand onto accumulator gas valve. At the same time, ensure that the release B of the FPU-1 is closed. Turn charging unit to a position where the gauge can be easily

3.3. TESTING

On bladder accumulators

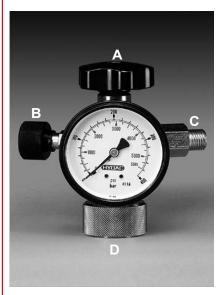

(FPU-1 with A3 or other suitable adaptor) open valve by turning

spindle A clockwise.
On piston and diaphragm accumulators (FPU-1) open valve V by turning the internal hexagon screw anticlockwise with spindle

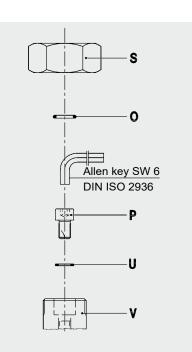

When the needle of the gauge begins to move, give the spindle another complete turn. The gauge now shows the charging pressure in the accumulator. The check valve C prevents any escape of nitrogen.

3.4. REDUCING THE PRE-CHARGE PRESSURE

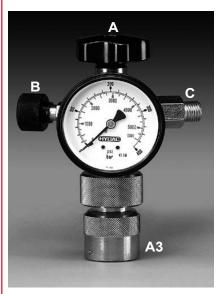

Carefully open release B. The nitrogen escapes into the atmosphere.

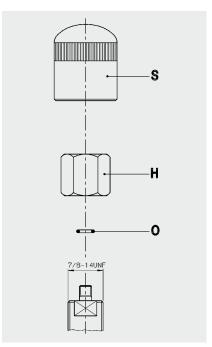

Charging and testing unit FPU-1 for piston and diaphragm accumulators

Gas valve for piston and diaphragm accumulators

Charging and testing unit for bladder accumulators with adaptor A3

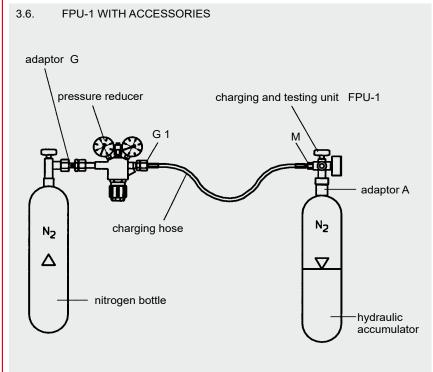

Gas valve for bladder accumulators

3.5. INCREASING PRE-CHARGE PRESSURE

Only use nitrogen for charging accumulators Never use oxygen! Danger of explosion! If the gas pressure in the nitrogen bottle is higher than the max. operating pressure of the accumulator, a gas pressure reducer must be fitted.

- Connect the flexible charging hose to the pressure reducer on the nitrogen bottle by means of the connector G1. For nitrogen bottles from other countries the appropriate adaptor is required (see page 15). Connect connector M of the charging hose to the check valve C of the charging and testing unit FPU-1. Open the shut-off valve on the nitrogen bottle, and slowly release nitrogen into the accumulator. Wait until approximately 1 bar has been reached before opening the shutoff valve of the nitrogen bottle further to enable faster charging.
- ☐ Interrupt the charging process from time to time and check the pre-charge pressure reached. Repeat this process until the required gas pre-charge pressure is achieved. After temperature equalisation has taken place, re-check the pre-charge pressure and adjust if necessary. If the pressure is too high, it can be lowered via the pressure release B of the FPU-1.
- If the required gas pre-charge pressure has been reached, turn the spindle anticlockwise to close the gas valve on bladder accumulators. On piston or diaphragm accumulators close the internal hexagon screw P by turning the spindle clockwise. Discharge the charging and testing unit FPU-1 via the pressure release and remove it by loosening the connector. On bladder accumulators, unscrew the adaptor and replace the O-ring O. On piston and diaphragm accumulators, tighten the internal hexagon screw P with Allen key [20 Nm].
- Check for leakages on the accumulator gas valve using a leak detector spray.
- Screw on cap nut H (only on bladder accumulators) and valve protection cap S onto the gas valve of the accumulator and tighten.

3.7. WARNING

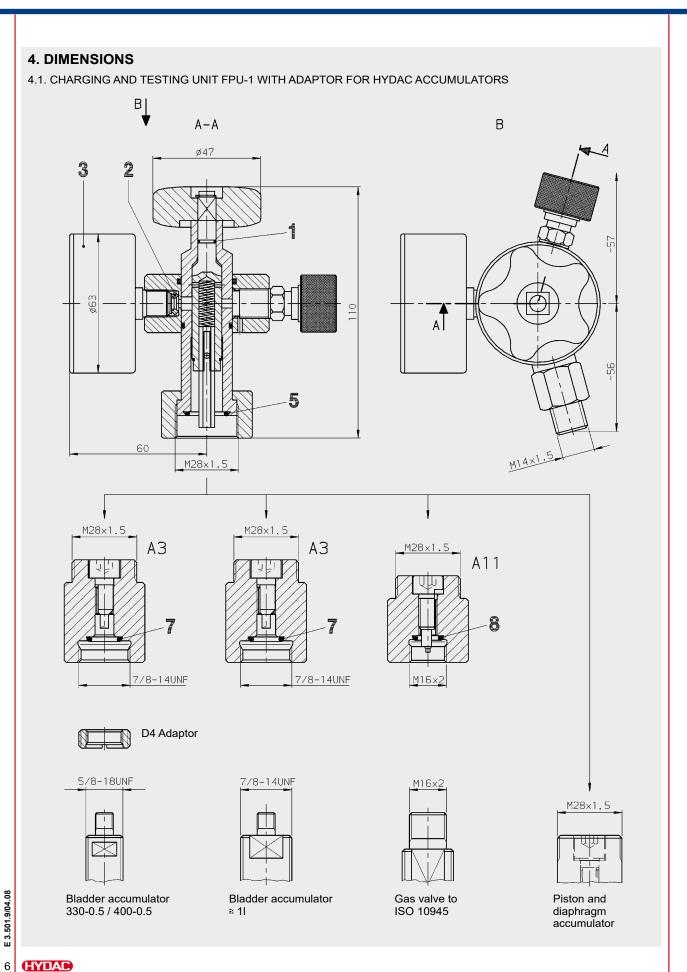

Nitrogen and operating fluid can escape when filling or testing the accumulator due to a faulty, i.e. leaking, bladder, diaphragm or piston seals.

Caution!

Risk to health in the case of aggressive fluids! (special charging and testing unit available on request)

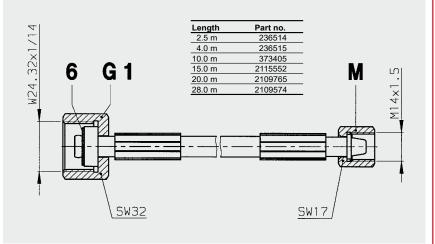

- The check valve C must not be removed. The valve has a safety function for the whole charging and testing unit.
- During charging, by a compressor or nitrogen charging system connected upstream, continuous operation can lead to unacceptable increases in temperature.
- Rest periods must therefore be incorporated into the charging procedure and the FPU-1 must be allowed to cool down.

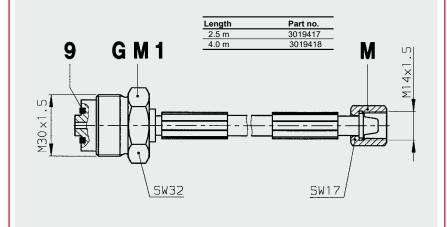

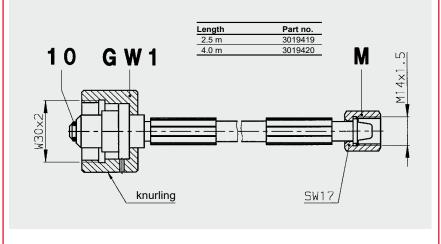

4.2. CHARGING HOSE **F** (200 bar nitrogen bottle - connection to DIN 477, part 1)

4.3. CHARGING HOSE $\,$ FM (300 bar nitrogen bottle - connection to DIN 477, part 5 to April 2002)

4.4. CHARGING HOSE $\,$ **FW** (300 bar nitrogen bottle - connection to DIN 477, Part 5 from April 2002)

Charging hoses are suitable for the respective published maximum permissible operating pressures and 10,000 charging processes. (HYDAC charging hoses comply with the EC machine directive and with DIN EN 982 and DIN EN 853 to 857).

4 ADAPTORS A1 TO A12 The universality of the FPU-1 is guaranteed because as well as HYDAC piston and diaphragm accumulators, bladder accumulators can also be charged and tested using the A3 adaptor.

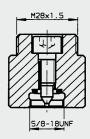

> By using additional adaptors other makes of accumulator can also be charged and tested.

6. CHARGING AND TESTING BLOCK F + P

The HYDAC charging and testing block F+P is used to charge and test back-up type hydraulic accumulators. It has connections for the charging and testing unit FPU-1 and for pressure gauges. As a safety function, a gas safety valve GSV6 can be fitted. In addition it allows the back-up nitrogen bottles to be shut off from the hydraulic accumulator.

8. NITROGEN CHARGING

HYDAC nitrogen charging units facilitate fast and cost-effective filling or testing of the required gas pre-charge pressure in bladder, diaphragm or piston accumulators. They guarantee optimum use of commercially available nitrogen bottles up to a residual pressure of 20 bar and a maximum accumulator pressure of 350 bar. Portable, mobile and stationary types of N2 Server are available. For further details and technical specifications, see HYDAC brochure "Nitrogen Charging Unit N2 Server", no.: E 2.201.

9. NOTE

The information in this brochure relates to the operating conditions and applications described. For applications or operating conditions not described, please contact the relevant technical department.

Subject to technical modifications.
