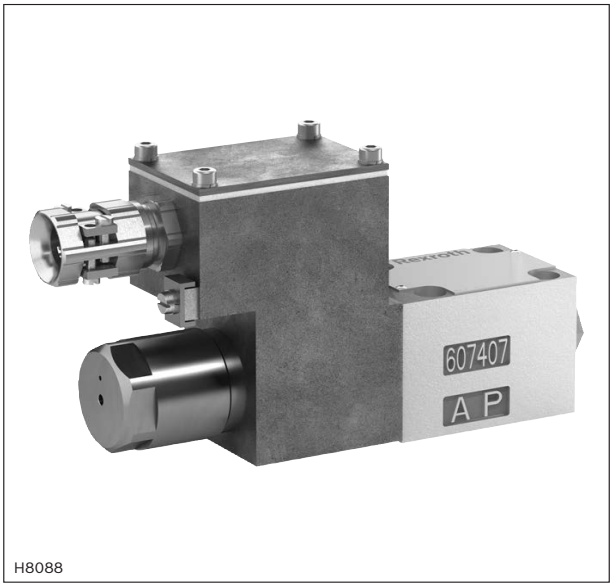
rexroth
A Bosch Company

Directional seat valves, direct operated, with solenoid actuation

Type SED ...XE



H8088

- Size 6
- Component series 1X
- Maximum operating pressure 350 bar
- Maximum flow 25 l/min

CE

ATEX units
For potentially explosive atmospheres

Information on explosion protection:

- Area of application in accordance with the Explosion Protection Directive 2014/34/EU: **II 2G; II 2D**
- Type of protection valve:
  - Ex h IIC T4 Gb X according to EN 80079-36
  - Ex h IIIC T115°C Db X according to EN 80079-36
- Type of protection, solenoid coil:
  - Ex eb mb IIC T4 Gb according to EN 60079-7 / EN 60079-18
  - Ex tb IIIC T115°C Db according to EN 60079-31
- Solenoid coil certified according to IECEx

Features

- 3/2 or 4/2-way version
- For intended use in potentially explosive atmospheres
- Porting pattern according to ISO 4401-03-02-0-05 (however, **without** locating hole)
- Wet-pin DC or AC solenoids
- Electrical connection with individual connection and cable gland
- With concealed manual override, optional

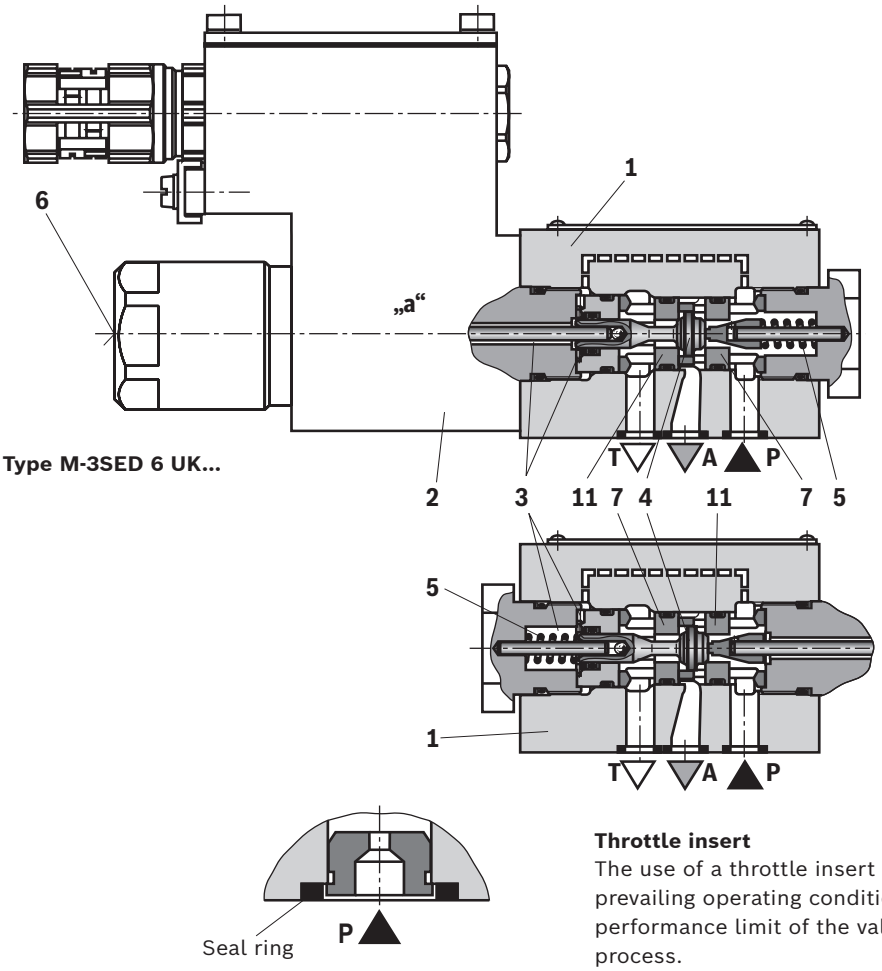
Function, section, symbols: 3/2 directional seat valve

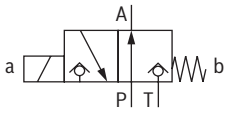
General
Directional valves of the type SED are direct operated directional seat valves with solenoid actuation. They control start, stop and direction of flow.
Directional valves basically comprise the housing (1), the solenoid (2), the valve seats (7) and (11) and the control spool (4).
The manual override (6) allows for the switching of the valve without solenoid energization.
For unobjectionable functioning, the hydraulic system has to be bled properly.

Basic principle
The initial position of the valve (normally open "UK" or normally closed "CK") is determined by the arrangement of the spring (5). The chamber (3) behind the control spool (4) is connected to port P and sealed against port T.
Thus, the valve is pressure-compensated in relation to the actuating forces (solenoid and spring).
By means of the control spool (4), ports P, A and T can be loaded with the maximum operating pressure (350 bar), and the flow can be directed in both directions (see symbols).
In the initial position, the control spool (4) is pressed onto the seat (11) by the spring (5); in spool position, it is pressed onto the seat (7) by the solenoid (2). The flow is blocked.
Seat valves can be used according to the symbols as well as the assigned operating pressures and flows (see performance limits on page 8).

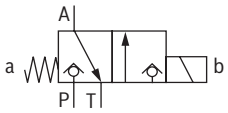


Type M-3SED 6 UK...

Symbol “UK”



Symbol “CK”



Throttle insert
The use of a throttle insert is required when, due to prevailing operating conditions, flows which exceed the performance limit of the valve occur during the switching process.

Function, section, symbols: 4/2 directional seat valve

With a sandwich plate, the **Plus-1 subplate**, under the 3/2 directional seat valve, the function of a 4/2 directional seat valve is achieved.

Function of the Plus-1 subplate

- Initial position
  The main valve is not actuated. The spring (5) holds the control spool (4) on the seat (11). Port P is blocked, and A is connected to T. Apart from that, one control line is connected from A to the large area of the control spool (8), which is thus unloaded to the tank. The pressure applied via P now pushes the ball (9) onto the seat (10). Now, P is connected to B, and A to T.
- Transition position
  When the main valve is operated, the control spool (4) is shifted against the spring (5) and pressed onto the seat (7). During this, port T is blocked, P, A, and B are briefly connected to each other.
- Spool position
  P is connected to A. As the pump pressure acts via A on the large area of the control spool (8), the ball (9) is pressed onto the seat (12). Thus, B is connected to T, and P to A. The ball (9) in the Plus-1 subplate has a "positive spool overlap".

Notice:
When operating 4/2 directional seat valves to control differential cylinders, the annulus area of the cylinder must only be connected with connection A of the valve. Otherwise, pressure peaks can be created while switching, which will exceed the maximum operating pressure.

The use of the Plus-1 subplate and the seat arrangement offer the following options:

General			
Installation position			any
Ambient temperature range		°C	–20 ... +70 [1]
Storage temperature range		°C	+5 ... +40
Maximum storage time		Years	1
Maximum admissible acceleration a_{max}		g	10
Weight	▶ 3/2 directional seat valve	kg	3.1
	▶ 4/2 directional seat valve	kg	3.9
Surface protection			Galvanized
Maximum surface temperature		°C	See information on explosion protection, page 7

Hydraulic		
Maximum operating pressure	bar	See table page 8
Maximum flow	l/min	25
Hydraulic fluid		See table below
Hydraulic fluid temperature range	°C	–20 ... +80 (NBR seals) –15 ... +80 (FKM seals)
Viscosity range	mm^2/s	2.8 ... 500
Maximum admissible degree of contamination of the hydraulic fluid Cleanliness class according to ISO 4406 (c)		Class 20/18/15 [2]

Hydraulic fluid		Classification	Suitable sealing materials	Standards	Data sheet
Mineral oils		HL, HLP, HLPD	FKM, NBR	DIN 51524	90220
Bio-degradable	▶ Insoluble in water	HETG	FKM	ISO 15380	90221
		HEES	FKM		
	▶ Soluble in water	HEPG	FKM	ISO 15380	

☞ **Important information on hydraulic fluids:**
- For further information and data on the use of other hydraulic fluids, please refer to the data sheets above or contact us.
- There may be limitations regarding the technical valve data (temperature, pressure range, life cycle, maintenance intervals, etc.).
- The ignition temperature of the hydraulic fluid used must be 50 K higher than the maximum surface temperature.
- **Bio-degradable and flame-resistant – containing water:** If components with galvanic zinc coating (e.g. version "J3" or "J5") or parts containing zinc are used, small amounts of dissolved zinc may get into the hydraulic system and cause accelerated aging of the hydraulic fluid. Zinc soap may form as a chemical reaction product, which may clog filters, nozzles and solenoid valves - particularly in connection with local heat input.

[1] Observe the "Special application conditions for safe application" on page 7.

[2] The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents faults and simultaneously increases the life cycle of the components.
Available filters can be found at www.boschrexroth.com/filter.

[3] Ex h: structural safety c according to EN 80079-37.
[4] Surface temperature > 50 °C, provide contact protection.

☞ **Special application conditions for safe application:**
- Connection lines must be installed in a strain-relieved way. The first mounting point must be within 150 mm of the cable and line entry.
- Maximum ambient temperature:
  In case of bank assembly, as long as only one solenoid is energized at a time, and in case of individual assembly +70 °C
  In case of bank assembly when several solenoids are energized simultaneously +60 °C
- The maximum temperature of the surface of the valve jacket is 115 °C. This has to be considered when selecting the connection cable and/or contact of the connection cable with the surface of the jacket is to be prevented.

Switching times (installation position: solenoid horizontal)

Pressure *p* in bar	**Flow q_V** in l/min	**Switching times *t*** in ms

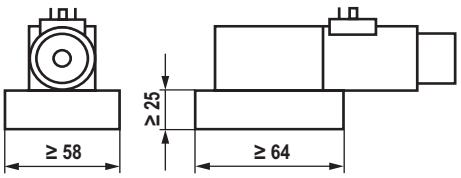
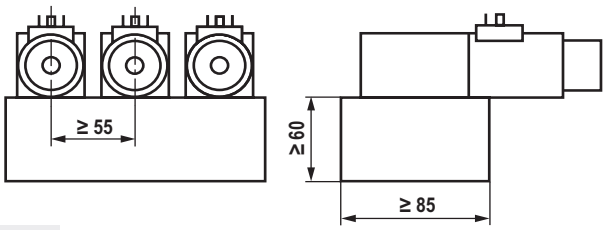
Installation conditions
(dimensions in mm)

	Individual assembly	Bank assembly
Subplate dimensions	Minimum dimensions length ≥ 64, width ≥ 58, height ≥ 25	Minimum cross-section height ≥ 60, width ≥ 85
Thermal conductivity of the subplate	≥ 36.2 W/mK	
Minimum distance between the longitudinal valve axes	≥ 55	

Individual assembly



Bank assembly

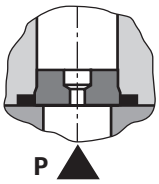


Notice:
Observe the "Special application conditions for safe application" on page 7 with regard to the hydraulic fluid temperature.

Throttle insert

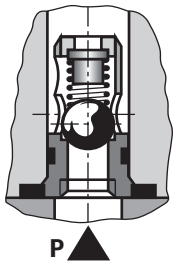
The use of a throttle insert is required when, due to prevailing operating conditions, flows which exceed the performance limit of the valve can occur during the switching processes.

Examples:
- Accumulator operation,
- Use as pilot control valve with internal pilot fluid tapping.



Check valve insert

The check valve insert allows a free flow from P to A and closes A to P.



General information

Seat valves can be used according to the symbols as well as the assigned operating pressures and flows (see performance limits, page 8).
In order to ensure safe functioning, it is absolutely necessary to observe the following:
- Seat valves have a negative spool overlap, i.e. during the switching process, there is leakage oil. However, this process takes place within such a short time that it is irrelevant in nearly all applications.
- The specified maximum flow must not be exceeded (use a throttle insert for flow limitation, if necessary).

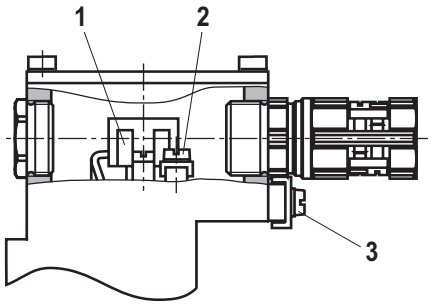
Plus-1 subplate:
- If the Plus-1 subplate (4/2 directional function) is used, the following lower operating values have to be observed:
  p_{min} = 8 bar, q_V > 3 l/min.
- Ports P, A, B and T are clearly specified according to their tasks. They must not be exchanged or closed.
- Port T must always be connected.
- Observe the pressure level and pressure distribution.
- The flow is only admissible in the direction of arrow.

Bosch Rexroth AG, RE 22049-XE, edition: 2020-11

Electrical connection

The type-examination tested solenoid coil of the valve is equipped with a terminal box, a type-examination tested cable entry and a type-examination tested blind plug.
The connection is polarity-independent.
Solenoid coils to be connected to AC voltage are equipped with an integrated rectifier.

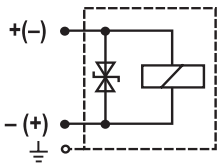
☞ **Notice:**
When establishing the electrical connection, the protective grounding conductor (PE ⏚) has to be connected properly.

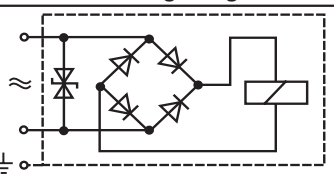


Properties of the connection terminals and mounting elements

Position	Function	Connectable line cross-section
1	Operating voltage connection	single-wire 0.75 ... 2.5 mm² finely stranded 0.75 ... 1.5 mm²
2	Connection for protective grounding conductor	single-wire max. 2.5 mm² finely stranded max. 1.5 mm²
3	Connection for potential equalization conductor	single-wire max. 6 mm² finely stranded max. 4 mm²

Connection line		
Line type		Non-armored and non-shielded connection lines
Temperature rating	°C	≤–20 ... ≥+110
Line diameter	mm	7 ... 10.5

Direct voltage, polarity-independent	Alternating voltage
	




☞ **Notice:**
Only use finely stranded conductors if they have pressed-on wire end ferrules.

Over-current fuse and switch-off voltage peaks

Voltage data in the valve type code	Nominal voltage Valve solenoid	Rated current Valve solenoid	Rated current External miniature fuse: medium time-lag (M) according to DIN 41571 and EN/IEC 60127	Rated voltage for external miniature fuse: medium time-lag (M) according to DIN 41571 and EN/IEC 60127	Maximum voltage value when switching off	Suppression circuit
G24	24 V DC	0.708 A DC	800 mA	250 V	-90 V	Suppressor diode Bi-directional
G110	110 V DC	0.155 A DC	200 mA	250 V	-390 V	
W110R	110 V AC	0.163 A AC	200 mA	250 V	-3 V	Bridge rectifier and suppressor diode
W230R	230 V AC	0.078 A AC	80 mA	250 V	-3 V	

☞ **Notice:**
A fuse which corresponds to the rated current according to DIN 41571 and EN / IEC 60127 has to be connected upstream of every valve solenoid (max. 3 x I_{rated}).
The shut-off threshold of the fuse has to match the prospective short-circuit current of the supply source.
The prospective short-circuit current of the supply source may amount to a maximum of 1500 A.

This fuse may only be installed outside the potentially explosive atmospheres or must be of an explosion-proof design.
When inductivities are switched off, voltage peaks result which may cause faults in the connected control electronics.
