RE 10092/2023-03-15 Replaces: 12.2017

External gear pump SILENCE AZPT

- ▶ Platform N
- ► Fixed displacement
- ▶ Nominal size 20 to 36
- ► Continuous pressure up to 250 bar
- ▶ Intermittent pressure up to 280 bar

Features

- Optimized pressure pulsation, reduces noise emissions and oscillations in the system
- ► Consistently high quality due to high-volume series production
- ► Long service life
- ▶ Slide bearings for high loading
- Drive shafts conforming to ISO or SAE and customerspecific solutions
- ► Port connections: Connection flanges or screw-in threads
- ► Combinations of several pumps possible

Product description

General information

It is the central task of external gear pumps to convert mechanical energy (torque and speed) into hydraulic energy (flow and pressure). To reduce heat losses, Rexroth's external gear units offer very high efficiencies. They are realized by pressure-dependent gap sealing and highly precise production technology.

Rexroth external gear pumps are built in four frame sizes: Platform B, F, N and G. Within each platform different sizes can be realized by different gear widths. The pumps are available in the versions Standard, High-Performance, SILENCE und SILENCE PLUS. Further configuration variants are given by different flanges, ports, shafts, valve arrangements and multiple pump combinations. Moreover, in the low-noise SILENCE pumps, the dual-flank principle helps to reduce flow pulsation by up to 75%.

Pumping principle

The geometry of the displacement gearing, matched in form by the rotation of the drive shaft, results in the parabolic flow characteristic shown here on the next page. In a standard pump, this characteristic is repeated each time a gear tooth meshes. With their dual-flank system, the flow pulsation of SILENCE pumps is reduced by 75% — with correspondingly lower excitation of downstream system components — at double the fundamental frequency. During this process, the gear pair exhibits an extremely reduced rear flank backlash, so that hydraulic sealing is provided not just by the front flank of the driven gear, but also by the rear flanks. In this way, the front and rear

flanks alternately contribute to flow displacement. And by adapting the shape of the metering notches, the expansion of the hydraulic line of action is half that of the standard pump.

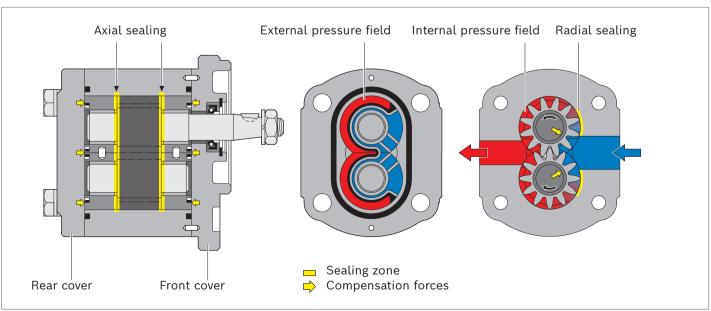

Construction

The external gear pump consists essentially of a pair of gear wheels supported in bearing bushings and the housing with a front cover and a rear cover.

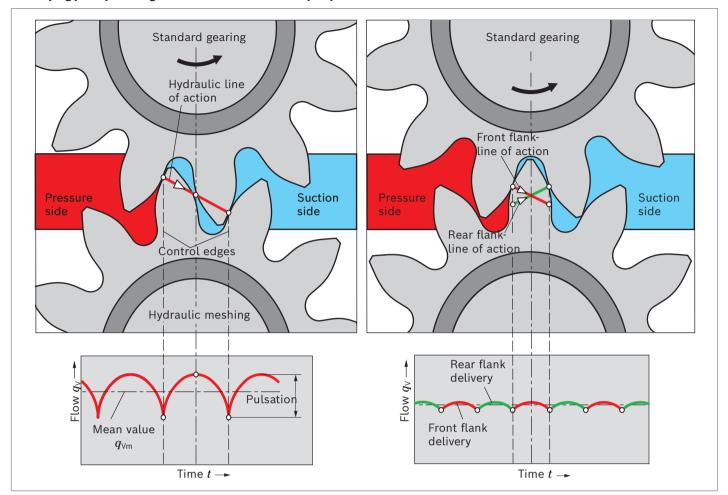

The drive shaft protrudes from the front cover where it is usually sealed by the shaft seal. The bearing forces are absorbed by slide bearings. These bearings were designed for high pressures and have excellent emergency running properties, especially at low rotational speeds.

The gear wheels have 12 teeth. This keeps both flow pulsation and noise emission to a minimum. The sealing of the pressure chambers is achieved by forces depending on the working pressure. This ensures optimum efficiency. The working pressure generated in the gear chambers is transferred to the outside of the bearing bushings in specifically designed pressure fields in such a way that they are pressed against the gears and seal them up. The pressurized compression areas are limited by special seals. The seal in the area between the gear teeth and the housing is ensured by the smallest of gaps that are set depending on the pressure between the gear teeth and housing.

Corrosion protection

| Version 1 (phosphated): Unit with low corrosion protection | The surface serves for protection against flash rust during tran | nsport or as priming for painting. |
|--|--|------------------------------------|
| Version 2 (galvanized, passivated): Unit with corrosion protection | Degree of corrosion and rust according to DIN EN ISO 9227 | Test duration 96 h: no red rust |

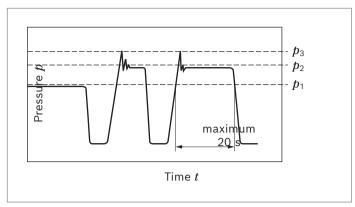

Notice

- ► Safety requirements pertaining to the whole systems are to be observed.
- ► Please contact us for applications with frequent load changes.

 $_{
m 1)}$ In the case of tandem pumps, the suction-side pressure difference between the individual pump stages must not exceed 0.5 bar.

²⁾ Limited service life with threaded ports (applicable for applications with $p_2 > 210$ bar)

▼ Pressure definition

p₁: Maximum continuous pressure

p₂: Maximum intermittent pressure

p₃: Maximum pressure peaks

Flow $q_{\text{v}} = \frac{V_{\text{g}} \times n \times \eta_{\text{v}}}{1000}$ [I/min] Torque $M = \frac{V_{\text{g}} \times \Delta p}{20 \times \pi \times \eta_{\text{hm}}}$ [Nm] Power $P = \frac{2 \pi \times M \times n}{60000} = \frac{q_{\text{v}} \times \Delta p}{600 \times \eta_{\text{t}}}$ [kW]

Key

 $V_{\rm g}$ Displacement per revolution [cm 3]

 Δp Differential pressure [bar] ($\Delta p = p - p_e$)

 $\it n$ Rotational speed [rpm]

 $\eta_{\scriptscriptstyle
m V}$ Volumetric efficiency

 $\eta_{
m hm}$ Hydraulic-mechanical efficiency

 $\eta_{\rm t}$ Total efficiency ($\eta_{\rm t}$ = $\eta_{\rm v} \times \eta_{\rm hm}$)

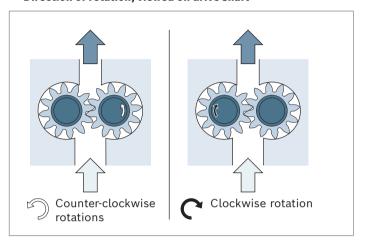

Notice

You can find diagrams for a rough calculation in chapter "Diagrams/Characteristic curves".

Direction of rotation

The dimensional drawings in the chapter Dimensions represent pumps for clockwise rotation. The position of the drive shaft and/or the position of suction and pressure port changes for counter-clockwise rotation.

▼ Direction of rotation, viewed on drive shaft

Hydraulic fluid

The external gear unit is designed for operation with HLP mineral oil according to DIN 51524, 1-3. Under higher load, however, Bosch Rexroth recommends at least HLP compliant with DIN 51524 Part 2.

See the following data sheet for application instructions and requirements for selecting hydraulic fluid, behavior during operation as well as disposal and environmental protection before you begin project planning:

▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons

Other hydraulic fluids on request.

Selection of hydraulic fluid

.Bosch Rexroth evaluates hydraulic fluids on the basis of the Fluid Rating according to the technical data sheet 90235.

Hydraulic fluids with positive evaluation in the Fluid Rating are provided in the following technical data sheet:

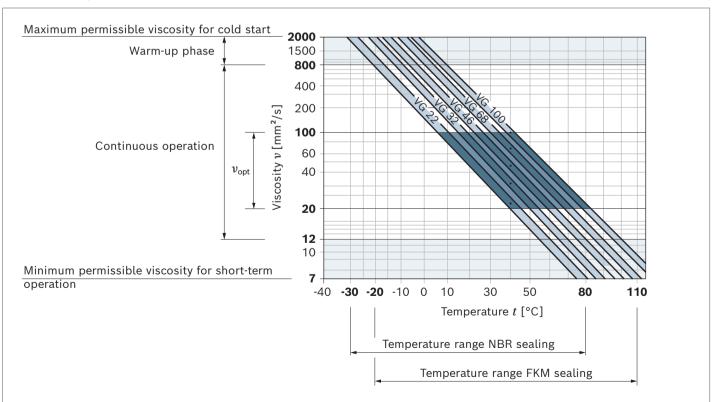

▶ 90245: Bosch Rexroth Fluid Rating List for Rexroth hydraulic components (pumps and motors)

Selection of hydraulic fluid shall make sure that the operating viscosity in the operating temperature range is within the optimum range (ν_{opt} see "Selection diagram")

Viscosity and temperature of hydraulic fluids

| Viscosity range | |
|--|---|
| Permissible in continuous operation | ν = 12 800 mm ² /s |
| Recommended in continuous operation | $v_{\rm opt}$ = 20 100 mm ² /s |
| Permissible for cold start | $v_{\text{max}} \le 2000 \text{ mm}^2/\text{s}$ |
| Temperature range | |
| With NBR seals (NBR = nitrile rubber) | t = -30 °C +80 °C |
| With FKM seals (FKM = fluorocarbon rubber) | t = -20 °C +110 °C |

▼ Selection diagram

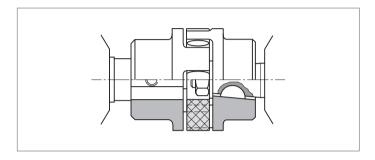

Observe the instructions for the filtration of the hydraulic fluid (see chapter "Project planning information").

Drive

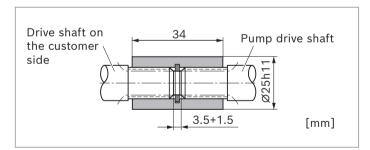

1. Elastic couplings

- ► The coupling must not transfer any radial and axial forces onto the pump.
- ► The radial runout deviation from the shaft to the spigot should not exceed 0.2 mm.
- ► Admissible shaft shifting see installation information of the coupling manufacturers.

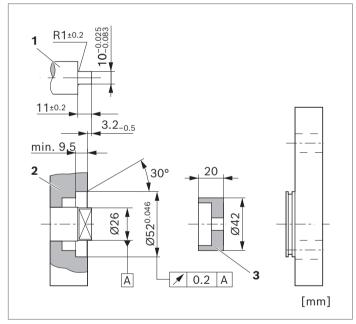

2. Coupling sleeve

- ➤ To be used on splined shaft profile according to DIN and SAE.
- ► Attention: No radial or axial forces are permitted on the pump drive shaft or coupling sleeve. The coupling sleeve must be free to move axially.
- ► The distance between the pump drive shaft and drive shaft on the customer side must 3.5+1.5 mm.
- ▶ Reserve installation space for the retaining ring.
- ▶ Oil-bath or oil-mist lubrication is required.

3. Tang drive coupling

- ► For attaching the pump directly to an electric motor or combustion engine, gearbox, etc.
- ► Pump drive shaft with special tang drive coupling and driver (3) (scope of delivery see offer drawing)
- ▶ No shaft seal
- Drive-side installation and sealing according to the following recommendations and dimensions
- ▶ Drive shaft on the customer side (1)
 - Case-hardened steel DIN EN 10084, e.g. 20MnCrS5 case-hardened 1.0 deep; HRA 83±2
 - Seal ring contact surface ground without rifling $R_t \le 4 \mu m$
- Radial shaft seal ring on the customer side (2)
 - Provide with rubber cover (see DIN 3760, type AS, or double-lipped ring)
 - Provide installation edges with 15° chamfer or install shaft seal with protection sleeve

Multiple gear pumps

Gear pumps are well-suited to multiple arrangements, whereby the drive shaft of the first pump stage is extended to a second and possibly third pump stage. The shaft of the individual pump sections are normally connected via a driver or via a splined coupling (reinforced through drive). The individual pump stages are usually hydraulically isolated and have separate suction ports. On request a common suction port or separated but hydraulically connected suction ports are available.

For the configuration of multiple pumps, Bosch Rexroth recommends arranging the pump stage with the largest displacement on the drive side.

Notice

Basically, the parameters of the single pumps apply, however certain restrictions need to be observed:

► Maximum rotational speed:

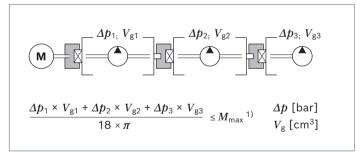

This is determined by the largest pump stage used.

▶ Pressures:

These are restricted by the maximum transmissible torques of the drive shaft, the through drive and the driver.

Addition of drive torques

Please note, that in multiple pump arrangements the drive torques of the individual pump stages will add up according to the following formula:

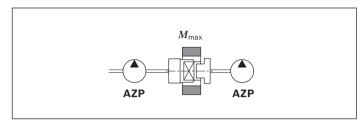

This may result in pressure restrictions for the respective pump stages.

Standard through drive (tang drive coupling)

For Platform N (AZPN, AZPT) pumps, the driver for the next pump stage can support loads up to $M_{\rm max}$ = 95 Nm. This may result in pressure limitations for subsequent pump stages.

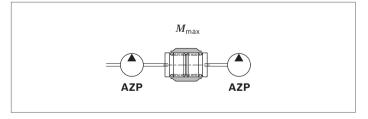

Subsequent pumps of a smaller series determine the maximum transmissible torque.

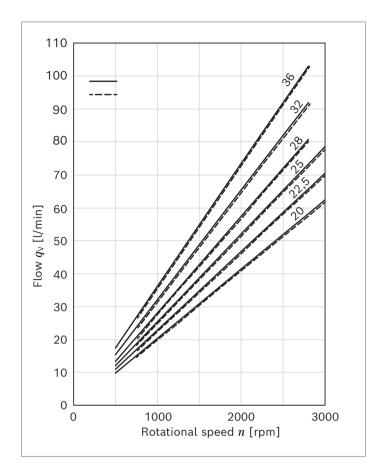

| Following pump | | M _{max} [Nm] |
|----------------|---------|-----------------------|
| | AZPN-1x | 95 |
| Platform N | AZPN-2x | 95 |
| | AZPT | 95 |
| | AZPW | 52 |
| | AZPF-1x | 65 |
| Platform F | AZPF-2x | 85 |
| FlationiiiF | AZPS-1x | 65 |
| | AZPS-2x | 85 |
| | AZPJ | 65 |
| Platform B | AZPB-3x | 25 |

Reinforced through drive

Reinforced through drives (for up to M_{max} = 160 Nm) are available for applications with higher torques/torsional vibrations. Design available on request.

Flow characteristic curves

- p = 20 bar

 p_2 = maximal intermittierend

 $q_{V} = f(n, V_{g})$

Notice

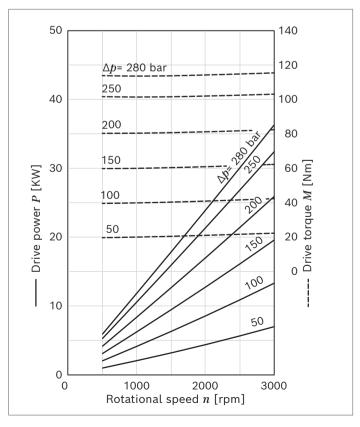

Characteristic curves measured at ν = 32 mm²/s and t = 50 °C

Noise charts

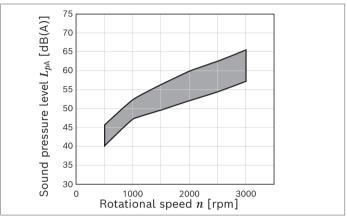

Noise levels dependent on the rotational speed, pressure range between 10 bar and pressure value p_2 (see chapter "Technical data").

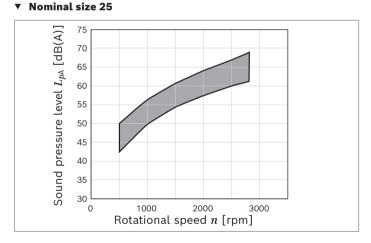

These are typical characteristic values for the respective size. They describe the airborne sound emitted solely by the pump.

Ambient influences (installation site, piping, other system components) were not taken into account.

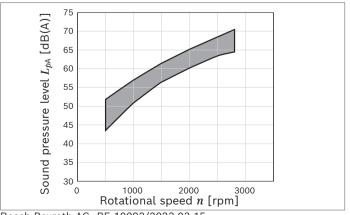

The values refer to one individual pump.

▼ Nominal size 20

Bosch Rexroth AG, RE 10092/2023-03-15

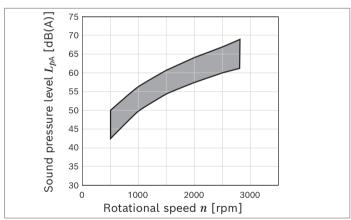

Notice

- Characteristic curves measured at $v = 32 \text{ mm}^2/\text{s}$ and t = 50 °C.
- ► Sound pressure level calculated from noise measurements made in the low reflection measuring room according to DIN 45635, Part 26.
- Distance from measuring sensor to pump: 1 m.

Project planning information

Technical data

All mentioned technical data are dependent on manufacturing tolerances and are applicable for certain boundary conditions.

Note that certain deviations are therefore possible and that technical data may vary when certain boundary conditions (e.g., viscosity) change.

Pumps delivered by Bosch Rexroth are tested for function and performance.

The pump may only be operated with the permissible data (see chapter "Technical data").

Characteristic curves

When dimensioning the gear pump, observe the maximum possible application data on the basis of the characteristic curves shown.

Application information

External gear units are not approved in on-highway vehicles for safety-relevant functions, as well as functions in the drive train, for steering, braking and level regulation. Classified as on-highway vehicles are e.g. vehicles such as motorbikes, private cars, trucks, vans, freight cars, buses and trailers. The European vehicle classes L (motorbikes), M (private cars), N (vehicles for transporting goods such as trucks and vans) and O (trailers and semi-trailers) serve as reference.

Notice

When used as an auxiliary steering pump, the vehicle manufacturer should make sure that the steering system continues to operate safely, even if the auxiliary steering pump fails (regulation similar to ECE R-79 can be referred).

Filtration of the hydraulic fluid

Since the majority of premature failures in gear pumps occur due to contaminated hydraulic fluid, filtration should maintain a cleanliness level of 20/18/15 as defined by ISO 4406. Thus contamination can be reduced to an acceptable degree in terms of particle size and concentration. Bosch Rexroth generally recommends full-flow filtration. The basic contamination of the hydraulic fluid filled in should not exceed class 20/18/15 as defined by ISO 4406. New fluids are often above this value. In such instances, a filling device with a special filter should be used. Bosch Rexroth is not liable for wear due to contamination. For hydraulic systems or devices with function-related, critical failure effects, such as steering and brake valves, the type of filtration selected must be adapted to the sensitivity of these devices.

Further information

Installation drawings and dimensions are valid at date of publication, subject to modifications.

Further information and notes on project planning can be found in the "General Operating Instructions for External Gear Units" (07012-B, chapter 5.5).

Information

AZ configurator

With our practical product selector, it will take you next to no time to find the right solution for your applications, no matter whether it is SILENCE PLUS or another external gear unit.

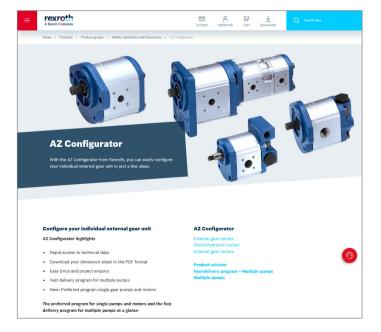

The selector guides you through a selection of features to all of the products available for order. By clicking on the order number, you can view and download the following product information: Data sheet, dimension sheet, operating conditions, and tightening torques.

You can order your selection directly via our online shop and at the same time benefit from an additional discount of 2%. And if you need something really quickly, simply use our fast delivery and preferred programs (GoTo). Then the goods will be sent within 10 working days.

You also have the possibility to easily and conveniently configure your individual external gear unit with our AZ configurator. All the necessary data that you need for the project planning of external gear units is requested by means of the menu navigation.

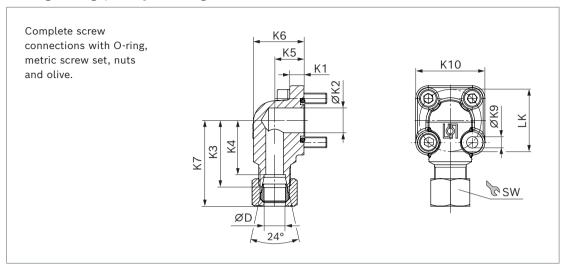

For an already existing configuration you receive as a result the order number, the type code, as well as further information. If your configuration does not lead to a product that is available for order, our online tools provide you with the possibility of sending a project request directly to Bosch Rexroth. We will then get in contact with you.
