rexroth
A Bosch Company

Directional spool valves, direct operated, with solenoid actuation

Type WE

H7832

- Size 10
- Component series 5X
- Maximum operating pressure 350 bar
- Maximum flow: 160 l/min – DC
  120 l/min – AC

CE

Features

- 4/3-, 4/2- or 3/2-way version
- Porting pattern according to ISO 4401-05-04-0-05
- High-power solenoid, optionally rotatable by 90°
- Electrical connection as individual or central connection
- Cartridge optionally equipped with PWM connector (fast switching amplifier, energy reduction)
- Manual override, optional
- CE conformity according to the Low-Voltage Directive 2014/35/EU for electrical voltages > 50 VAC or > 75 VDC
- Solenoid coil as approved component with UR marking, optional
- Approval according to CSA C22.2 no. 139-13, optional

Control spool play

14	Standard (recommended)	**no code**
	Minimum (selection for reduced leakage values; higher oil cleanliness required)	**T06**
	Increased (selection with high temperature difference hydraulic fluid/environment; leads to higher internal leakage values)	**T12**

Seal material (observe compatibility of seals with hydraulic fluid used, see page 12)

15	NBR seals	**M**
	FKM seals	**V**
	Recommended for operation with HFC hydraulic fluids	**MH**
	Low-temperature version (only with version "Without manual override")	**MT**

16	Standard	**no code**
	Approval according to CSA C22.2 no. 139-13	**CSA**
	Porting pattern according to ANSI B93.9	**AN** [7]

17	Further details in the plain text	*****

1) Only version "G..." and "W...R"

2) Operation of the manual override only possible up to 50 bar tank pressure. Avoid damage to the bore of the manual override. (Special tool for the operation, separate order, material no. **R900024943**). If the manual override is blocked, operation of the opposite solenoid is to be excluded. The manual override cannot be allocated a safety function.

3) With tank pressures higher than 50 bar, it is not guaranteed that the valve remains in the position into which it was switched by the lockable manual override ("N5").

4) Protective cap must be removed prior to actuation.

5) Not with low-temperature version "MT".

6) When throttle inserts are used in channel T, the pressure in the working ports and in case of connection to the tank chambers must not exceed 210 bar.

7) With power supply to
- ▶ solenoid "a", channel P is connected to A
- ▶ solenoid "b", channel P is connected to B

☞ **Notice:**
For directional spool valves NG10 with spool position monitoring, see data sheet 23352.

Maximum admissible overvoltages according to DIN EN 60664-1 (VDE 0110-1) (overvoltage category II):												
Nominal voltage U_{Nom}	in V	12	24	26	48	96	110	125	180	205	220
Rated current I_{Nom}	in A	3.44	1.61	1.51	0.86	0.44	0.38	0.33	0.26	0.21	0.19
Maximum admissible switch-off overvoltage according to VDE 0580	in V	500	500	500	500	500	500	500	500	500	500
Recommended interference protection circuit with 2 x nominal voltage	in V	24	48	52	96	192	220	250	360	410	440

1) Only with correctly mounted valve with a mating connector suitable for the protection class.

2) Protection class I with properly connected protective grounding conductor (PE) and valve mounting surface connected to the protective grounding conductor system.

3) With protection class III, a protective extra-low voltage with safety transformer (PELV, SELV) is to be provided.

4) Solenoid coils without "Recognized component" according to UL 429

5) Recommended for mobile applications; with additional sealing between solenoid coil and pole tube.

☞ **Notice:**
Solenoid valves induce voltage peaks during switch-off. In order to prevent electro-magnetic interference at the system and damage to the valve control, an interference protection circuit has to be provided on the system side. Alternatively, you can also select a connector with integrated interference protection circuit.

[1] Only with correctly mounted valve with a mating connector suitable for the protection class.

[2] Protection class I with properly connected protective grounding conductor (PE) and valve mounting surface connected to the protective grounding conductor system.

Notice:

- Solenoid valves induce voltage peaks during switch-off. In order to prevent electro-magnetic interference at the system and damage to the valve control, an interference protection circuit has to be provided on the system side. Alternatively, you can also select a connector with integrated interference protection circuit.
- Dependent on the rated current I_{Nom}, circuit breakers according to tripping characteristic "K" are to be provided. Within a time interval of 0.6s, the tripping current must be 8 to 10 times the nominal power supply.
  The required non-tripping current of the fuse must not fall below the "lower rated current" value I_1 (see table above).
  The maximum tripping current must not exceed the "upper rated current" value I_2 (see table above).
  The temperature dependence of the tripping behavior of the circuit breakers has to be observed according to the manufacturer's specifications.

	▶ 60 Hz	in A	1.2	1.2	–	–	1.20	0.6	0.6	–
Maximum admissible switch-off overvoltage according to VDE 0580		in V	500	500	500	500	500	500	500	500
Recommended interference protection circuit with 2 x nominal voltage		in V	200	200	–	–	240	400	400	–

1) Only with correctly mounted valve with a mating connector suitable for the protection class or suitable conduit system.

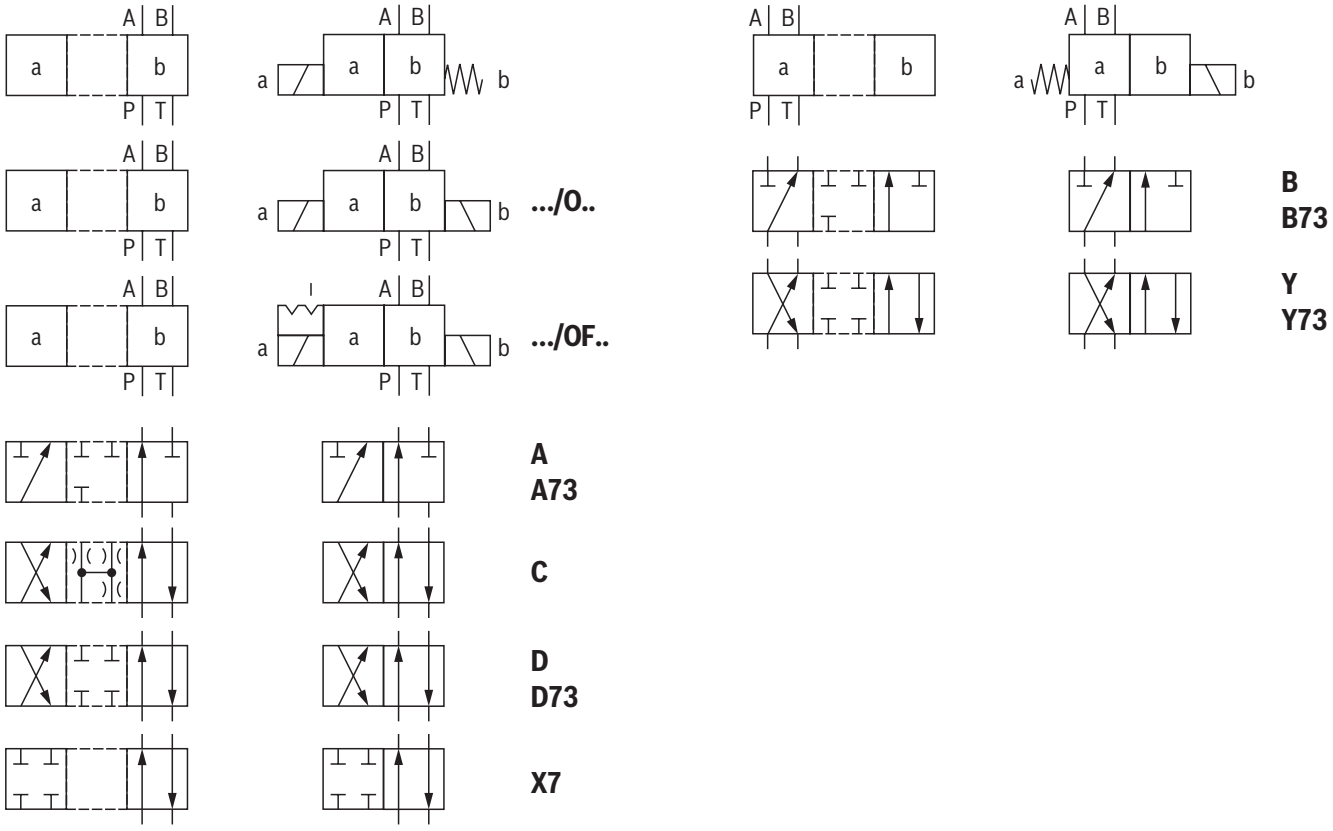
2) Protection class I with properly connected protective grounding conductor (PE) and valve mounting surface connected to the protective grounding conductor system.

3) Wire bridge between pin 2- and 4-.

☞ **Notice:**

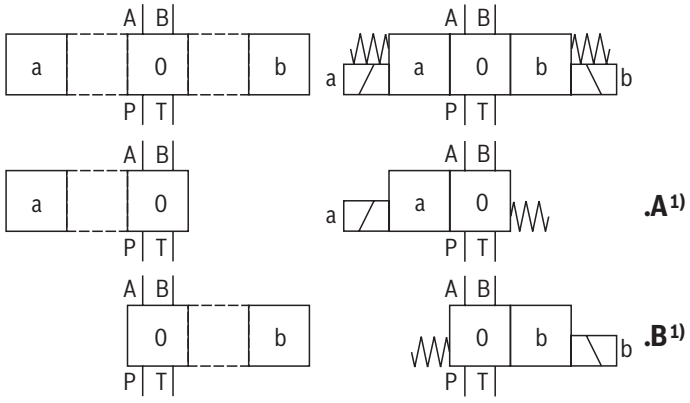
- Solenoid valves induce voltage peaks during switch-off. In order to prevent electro-magnetic interference at the system and damage to the valve control, an interference protection circuit has to be provided on the system side. For valves with integrated rectifier ("W...R"), no protection circuit on the system side is required. The rectifier in the valve completes this function.
- Dependent on the rated current I_{Nom}, circuit breakers according to tripping characteristic "K" are to be provided. Within a time interval of 0.6s, the tripping current must be 8 to 10 times the nominal power supply.
  The required non-tripping current of the fuse must not fall below the "lower rated current" value I_1 (see table above).
  The maximum tripping current must not exceed the "upper rated current" value I_2 (see table above).
  The temperature dependence of the tripping behavior of the circuit breakers has to be observed according to the manufacturer's specifications.

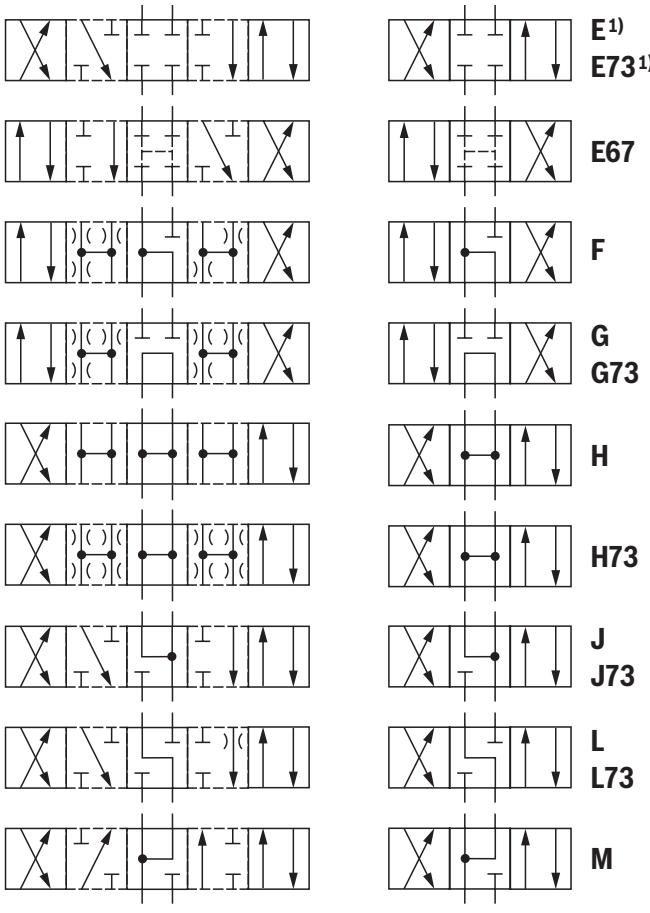
Symbols

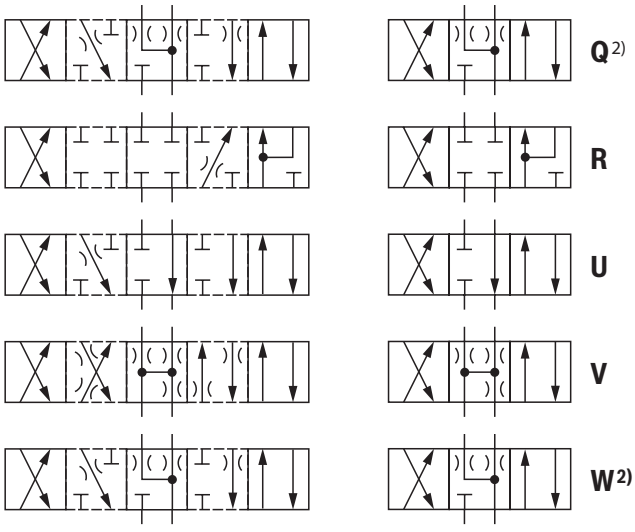


Notice:
Representation according to DIN ISO 1219-1.
Hydraulic interim positions are shown by dashes.

Symbols







1) **Example:**
- Symbol E with spool position "a" ordering code ..**EA**..
- Symbol E with spool position "b" ordering code ..**EB**..

2) Flow cross-section see page 12.

Notice:
- Representation according to DIN ISO 1219-1. Hydraulic interim positions are shown by dashes.
- Other symbols upon request.

Function, section

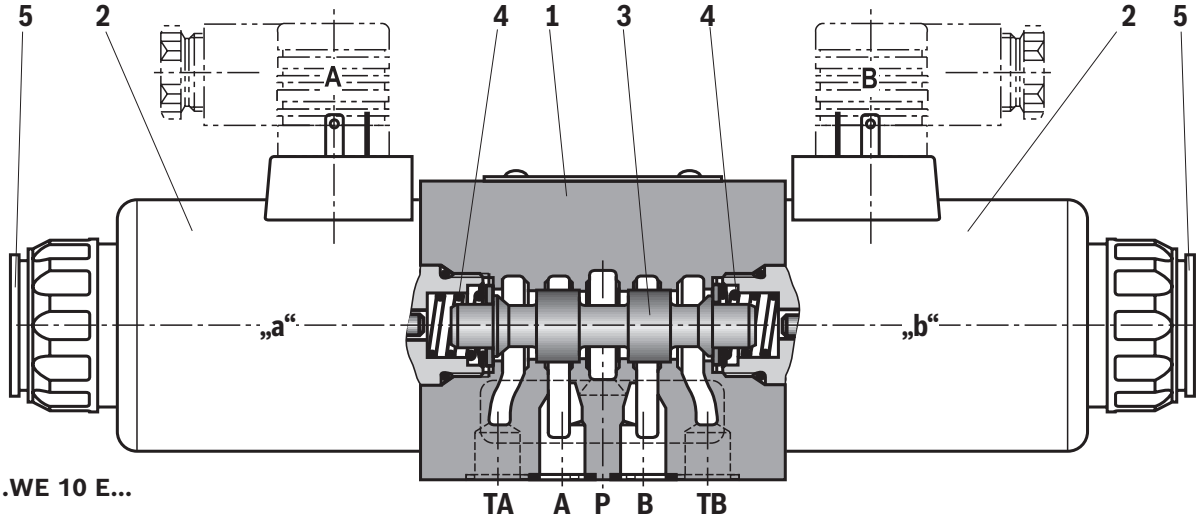
The directional valves of type WE are solenoid-actuated directional spool valves that can be used as electro-hydraulic component. They control the start, stop and direction of a flow.
The directional valves basically consist of the housing (1), one or two electronic solenoids (2), the control spool (3), and the return springs (4).
In the de-energized condition, the control spool (3) is held in the central position or in the initial position by the return springs (4) (except for version "O").
If the wet-pin electronic solenoid (2) is supplied with power, the control spool (3) moves out of its rest position into the required end position. In this way, the required direction of flow according to the selected symbol is released.
After the electronic solenoid (2) has been switched off, the control spool (3) is pushed back into its central position or into its initial position (except for valves with "OF" detent and valves without type "O" spring).
A manual override (5) allows for the manual switching of the valve without solenoid energization.
For unobjectionable functioning, the hydraulic system has to be bled properly.

Without spring return "O" (only possible with symbols A, C and D)
This version is a directional valve with two spool positions and two electronic solenoids **without** detent. The valve without spring return at the control spool (3) has no defined basic position in the de-energized condition.

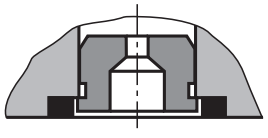
Without spring return with "OF" detent
(only possible with symbols A, C and D)
This version is a directional valve with two spool positions and two electronic solenoids **with** detent. The detents are used to fix the control spool (3) in the relevant spool position. During operation, continuous application of current to the electronic solenoid can thus be omitted which contributes to energy-efficient operation.

Version ".73...A12" (smooth switching behavior)
By means of structural design of the control spools and solenoids, switching shocks occurring when activating and deactivating the valves are significantly reduced. The switching shocks, measured as acceleration values ***a***, can be reduced by up to approx. 85% when compared to the standard valve depending on the design of the control spool (for this, see "Acceleration values" on page 14).

☞ **Notice:**
Pressure peaks in the tank line to two or several valves can result in unintended movements of the control spool in the case of version with detent.
We therefore recommend that separate return lines be provided or a check valve installed in the tank line.
Due to the design principle, internal leakage is inherent to the valves, which may increase over the life cycle.



Type .WE 10 E...



Throttle insert
The use of a throttle insert is required when, due to prevailing operating conditions, flows occur during the switching processes which exceed the performance limit of the valve.

Technical data
(For applications outside these values, please consult us!)

General				
Type of connection			Subplate mounting	
Porting pattern			ISO 4401-05-04-0-05	
Weight			Individual connection	Central connection
	▶ Valve with one solenoid	kg	3.9	4.0
	▶ Valve with two solenoids	kg	5.5	5.6
Installation position			any [1]	
Ambient temperature range	▶ NBR seals	°C	–20 ... +70 [2]	
	▶ FKM seals	°C	–15 ... +70 [2]	
	▶ Version for HFC hydraulic fluid	°C	–20 ... +50	
	▶ Low-temperature version [3]	°C	–40 ... +50	
Storage temperature range		°C	+5 ... +40	
Protection class according to EN 60529			see page 4 ... 7	
Maximum surface temperature [4]		°C	140	
$MTTF_D$ values according to EN ISO 13849	▶ Version "G..."	years	300 ... 2400 [5]	
	▶ Version "W..."		150 ... 1200 [5]	
	▶ Version "W...R"		300 ... 2400 [5]	
Conformity	▶ CE according to EMC directive 2014/35/EU, tested according to		EN 60204-1, classified as component	

1) With suspended installation, higher sensitivity to contamination. Horizontal installation is recommended.

2) Maximum +50 °C for version "W..."

3) For the use at low temperatures, see Project planning information on page 32.

4) Due to the arising surface temperatures of the solenoid coils, the standards ISO 13732-1 and ISO 4413 are to be observed. The specified surface temperature in AC solenoids is valid for fault-free operation. In the error case (e.g. blocking of the control spool), the surface temperature may increase above 180 °C. Thus, the system must be checked for possible dangers considering the ignition temperature of the hydraulic fluid used. As protection, circuit breakers (see table page 4 ... 7) must be used, unless the creation of an ignitable atmosphere can be excluded in a different way. Thus, the surface temperature can – in the error case – be limited to maximally 220 °C. You have to use connection cables that have been approved of for a working temperature of more than 90 °C (individual connection) and/or 105 °C (central connection). Contact between the connection cable and the coil surfaces must be prevented.

5) For further details, see data sheet 08012

☞ **Important information on hydraulic fluids:**

- For further information and data on the use of other hydraulic fluids, please refer to the data sheets above or contact us.
- There may be limitations regarding the technical valve data (temperature, pressure range, life cycle, maintenance intervals, etc.).
- The ignition temperature of the hydraulic fluid used must be 50 K higher than the maximum surface temperature.
- **Bio-degradable and flame-resistant – containing water:** If components with galvanic zinc coating (e.g. version "J3" or "J5") or parts containing zinc are used, small amounts of dissolved zinc may get into the hydraulic system and cause accelerated aging of the hydraulic fluid. Zinc soap may form as a chemical reaction product, which may clog filters, nozzles and solenoid valves – particularly in connection with local heat input.
- **Flame-resistant – containing water:**
  - Due to increased cavitation tendency with HFC hydraulic fluids, the life cycle of the component may be reduced by up to 30% as compared to the use with mineral oil HLP. In order to reduce the cavitation effect, it is recommended - if possible specific to the installation - to back up the return flow pressure in ports T to approx. 20% of the pressure differential at the component.
  - Dependent on the hydraulic fluid used, the maximum ambient and hydraulic fluid temperature must not exceed 50 °C. In order to reduce the heat input into the component, a maximum duty cycle of 50% in continuous operation has to be set for on/off valves (measuring time 300 s). If this is not possible due to the function, an energy-reducing control of these components is recommended, e.g. via a PWM plug-in amplifier.

[6] With symbols A and B, port T must be used as leakage oil connection if the operating pressure exceeds the maximum admissible tank pressure.

[7] The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents faults and at the same time increases the life cycle of the components.

Technical data
(For applications outside these values, please consult us!)

Electrical										
Voltage type				Direct voltage	Alternating voltage 50/60 Hz					
Supply voltage	▶ Nominal value		V	see page 4 and 5	100	120	200	230	With rectifier or version "W...R" [8]

	▶ OFF			20 ... 30	22 ... 82				250 ... 360	
Maximum switching frequency			1/s	4.2	2				2	
Protection class according to VDE 0580				see page 4 ... 7						
Insulation class VDE 0580				F	H	F	H	H	F	
Electrical protection				Maximum admissible switch-off overvoltage see page 4 ... 7 Every AC solenoid must be protected individually, using a suitable fuse with tripping characteristics K (inductive loads).						
Protective grounding conductor and screening				The valve contact surface must be connected to the equipotential bonding. Connector pin assignment (CE-compliant installation) see page 29 and 30						

[8] For single connection (version "G...") with customer-side rectifier and version "W...R":
- ▶ Mating connectors with rectifier see page 31
- ▶ Possible voltages see page 6 and 7
- ▶ Rectifiers must comply with the relevant standards as well as the coil performance data.
- ▶ With a central connection, the rectifier is on the board

[9] Reduction of the nominal power by approx. 40% if a 24 V-coil with plug-in switching amplifier type VT-SSBA1-PWM-1X/V00**2**/5 is used (separate order, material no. **R901290194**, see page 31 and data sheet 30362)

[10] Measured with flow, 80% performance limit and horizontal installation position.

[11] Not with symbols A, B and .73.

[12] Reduction of the switching time by approx. 50% if a 12 V-coil with plug-in switching amplifier type VT-SSBA1-PWM-1X/V00**1**/5 is used (separate order, material no. **R901265633**, see page 31 and data sheet 30362)

[13] Measured without flow

☞ **See notes** page 14.

Technical data
(For applications outside these values, please consult us!)

☞ **Notice:**

- Any simultaneous actuation of 2 solenoids of one valve must be ruled out.
- Due to possible overload of the board, valves with central connection must not be operated with twice the voltage.
- If the standard environmental conditions according to EN 60204-1 cannot be provided, the valve must be especially protected!
- **Energy saving**
  If directional valves with a nominal voltage of 24 V are used, a switching amplifier will reduce the continuous current considerably.
  After a defined power supply time and the connected hydraulic switching of the valve, the system switches to pulse width modulation and the power is considerably reduced. This leads to a holding power under the power of a valve with 24 V supply voltage (see data sheet 30362).
- **Fast switch-on**
  For accelerated switching on the solenoid side, valves with individual connection and a nominal voltage of 12 V or 24 V can be controlled with two times the voltage for a maximum of 100 ms (pulse width modulation see data sheet 30362). In this connection, the maximum admissible switching frequency is reduced to 3 1/s.
- **Dampened switching**
  With valves of version "A12", damping of the switch-on and switch-off process is possible (smoothly switching). In this way, switching shocks in the system are considerably reduced.

Performance limits: Version "G..." and "W...R" (measured with HLP46, ϑ_{oil} = 40 ±5 °C)

☞ **Notice:**
The specified performance limits are valid for operation with two directions of flow (e.g. from P to A and simultaneous return flow from B to T).
Due to the flow forces acting within the valves, the admissible performance limit may be considerably lower with only one direction of flow (e.g. from P to A while port B is blocked).
In such cases of use, please consult us.
The performance limits were determined when the solenoids were at operating temperature, at 10% undervoltage and without tank preloading.

Energy savings and fast switching [2]

Designation	Version	Material number	Data sheet
Type VT-SSBA1-PWM-1X/V00**1**/5	As fast switching amplifier (switching time reduction by approx. 50%) [3]	**R901265633**	30362
Type VT-SSBA1-PWM-1X/V00**2**/5	For energy reduction (energy savings of approx. 40%) [4]	**R901290194**	

[2] Only with symbols C, D, E, E67, J, J2 and Y; not for version "D" with reinforced compression spring

[3] Only for version "G12" and "K4/K4K"

[4] Only for version "G24" and "K4/K4K"

Use with PWM connector (data sheet 30362):

- Depending on the control spool, increasing the performance limit is possible.
- With version "G24" (energy saving), the coil temperature is reduced by ≥ 30 °C for 100% duty cycle.

Project planning information

Temperature range and maximum operating pressure in case of use at low temperatures

Port	**Pressure**	**Temperature range** in °C
P, A, B, T	static 100 bar	–40 ... –35
P, A, B	dynamically increasing from 100 bar to 350 bar in linear form as a function of the temperature	–35 ... –30
T	dynamically increasing from 100 bar to 210 bar in linear form as a function of the temperature	–35 ... –30
P, A, B, T	Maximum operating pressure	–30 ... +50
