2 Safety instructions

2.1 About this chapter

The product has been manufactured according to the generally accepted codes of practice. However, there is still the danger of personal injury and damage to property if you do not observe this chapter and the safety instructions in this documentation.

- Read this documentation completely and thoroughly before working with the product.
- Keep this documentation in a location where it is accessible to all users at all times.
- Always include the required documentation when you pass the product on to third parties.

2.2 Intended use

The product is a hydraulic valve for intended use in an explosive atmosphere.

The product is only intended for professional use and not for private use.

Intended use includes having read and understood this documentation.

Information on the admissible areas of application can be found in the "data sheet".

The hydraulic valve may only be operated in a technically perfect condition and used as described in these operating instructions. The connection conditions, application conditions and performance data defined in these operating instructions must not be changed.

2.3 Improper use

Any use deviating from the intended use is improper and thus inadmissible.

Bosch Rexroth AG does not assume any liability for damage caused by improper use. The user assumes responsibility for all risks surrounding improper use.

2.4 Qualification of personnel

The activities described in this documentation require basic knowledge of mechanics, electrics, hydraulics and pneumatics as well as knowledge of explosion protection. For transporting and handling the product, additional knowledge of how to handle lifting gear and the necessary attachment devices is required. In order to ensure safe use, these activities may only be carried out by an expert in the respective field or an instructed person under the direction and supervision of an expert.

2.5 Product-specific safety instructions

The following safety instructions apply to chapters 6 to 14.

⚠ WARNING**Explosion hazard due to ignitable atmosphere during all work on the hydraulic valve!**

During all work on the hydraulic valve (assembly, disassembly etc.), there must not be an explosive atmosphere. Otherwise, an ignition may be triggered which may lead to an explosion.

- Before working with the hydraulic valve, ensure that no explosive atmosphere can occur during the work.

⚠ WARNING**Easily inflammable liquid!**

In connection with an explosive atmosphere or other heat sources, the use of liquids (e.g. hydraulic fluids, coolants, cleaning agents) may lead to explosions.

- Only use the hydraulic valve in the intended explosion protection area.
- The ignition temperature of the liquid used must be 50 K higher than the maximum surface temperature of the hydraulic valve.

⚠ WARNING**Exceeding of maximum temperatures!**

Use of the hydraulic valve outside the approved temperature ranges may lead to functional failures like overheating of the solenoid coil. Explosion protection is therefore no longer ensured.

- Only use the hydraulic valve within the intended environmental and hydraulic fluid temperature range.

⚠ WARNING**Hot hydraulic valve surface!**

Risk of burning!

- Provide a suitable touch guard.
- During operation, only touch the hydraulic valve with heat-protective gloves. Allow the hydraulic valve to cool down to room temperature before touching it directly with your hands during maintenance works.

⚠ WARNING**Explosion hazard caused by electrical voltage!**

- Explosion hazard by opening the cover while the valve is applied to electrical voltage.
- Do not open the cover of the terminal box until the valve is de-energized and depressurized and there is no explosive atmosphere.

▲ WARNING**Pressurized system parts and leaking hydraulic fluid!**

When working at hydraulic systems with stored energy (accumulator or cylinders working under gravity), the hydraulic valve may even be pressurized after the pressure supply has been switched off. During assembly and disassembly works, the hydraulic valve or parts may fly around and cause personal injuries and/or damage to property. There is moreover the danger of serious injury caused by a leaking hydraulic fluid jet.

- Ensure before working at the hydraulic valve that the hydraulic system is depressurized and the electrical control de-energized.
- Completely unload the pressure at machines and systems before working at the hydraulic valve.

▲ WARNING**Non-compliance with functional safety!**

The hydraulic valve controls movements in machines or systems. In case of mechanical and electric faults, e.g. failure of the energy supply, persons may be caught by the system, slung away or bruised.

- During set-up of your circuit, observe functional safety e.g. according to EN ISO 13849.

▲ WARNING**Penetrating water and humidity!**

In case of use in humid or wet environments, water or humidity may penetrate electrical connections or the valve electronics. In this case, malfunctions may occur at the hydraulic valve.

- Only use the hydraulic valve within the intended IP protection class or lower.
- Ensure before the assembly that all seals and caps of the plug-in connections are tight and intact.

▲ CAUTION**Contaminated hydraulic fluid!**

Contamination in the hydraulic fluid may cause functional failures e.g. jamming or blocking of nozzles of the hydraulic valve. In the worst case, this can result in unexpected hydraulic functions.

- Ensure adequate hydraulic fluid cleanliness according to the specifications in the "data sheet" over the entire operating range.

▲ CAUTION**Leakage in case of incorrect working temperatures!**

Use of the hydraulic valve outside the approved temperature range may lead to permanent leakage.

- Only use the hydraulic valve within the intended environmental and hydraulic fluid temperature range.
- In case of leakage of hydraulic fluid, immediately exchange damaged seal rings or the hydraulic valve.

▲ CAUTION**Corrosion!**

The hydraulic valve has a surface protection, see "data sheet". Use of the hydraulic valve in humid environments still holds the danger of corrosion on the hydraulic valve and on the valve mounting screws and thus a reduction of the preload force of the screw connection. To avoid loosening of the hydraulic valve and mitigate the associated risk:

- Replace hydraulic valves with corrosion damage early.
- Check the surface protection on the hydraulic valve and the valve mounting screws at regular intervals.

Contact with salt water leads to increased corrosion at the hydraulic valve. This can lead to chemical corrosion of individual components of the hydraulic valve. Take suitable corrosion protection measures.

2.6 Notes on the valve use

The hydraulic valve must always be filled with hydraulic fluid.

2.7 Obligations of the machine end-user

The machine end-user of the Bosch Rexroth product is responsible for ensuring that the applicable provisions, rules and directives for explosion protection are observed.

IT security

The operation of installations, systems and machines basically requires the implementation of a holistic IT security concept which is state-of-the-art in terms of technology. Accordingly, Bosch Rexroth products and their properties have to be considered as components of installations, systems and machines for their holistic IT security concept. Unless otherwise documented, Bosch Rexroth products are designed for operation in local, physically and logically secured networks with access restrictions for authorized persons, and they are not classified according to IEC 62443-4-2.

3 General information on damage to property and damage to product

The warranty only applies to the delivered configuration.

- The claim to warranty expires if the product is assembled, commissioned and operated incorrectly, not used as intended and/or handled improperly.

NOTICE**Inadmissible mechanical load!**

Impact or shock forces on the hydraulic valve may damage or even destroy it.

- Never use the hydraulic valve as handle or step. Do not place/put any objects on top of it.

NOTICE	Dirt and foreign particles in the hydraulic valve! <p>Penetrating dirt and foreign particles in the hydraulic valve lead to wear and malfunctions. Safe function of the hydraulic valve can no longer be ensured.</p> <ul style="list-style-type: none">– During installation, ensure utmost cleanliness.– Before commissioning, ensure that all hydraulic connections are tight and that all seals and caps of the plug-in connections are correctly installed and undamaged.– Do not use linting fabric for cleaning.– Ensure that no cleaning agents are able to penetrate the hydraulic system.
NOTICE	Environmentally harmful hydraulic fluid! <p>Leaking hydraulic fluid leads to environmental pollution.</p> <ul style="list-style-type: none">– Immediately remedy possible leakage.– Dispose of the hydraulic fluid in accordance with the currently applicable national regulations in your country.

6 Transport and storage

6.1 Transporting the hydraulic valve

⚠ CAUTION

Danger of damage to property and personal injuries!

The hydraulic valve can fall down during improper transportation and lead to damage and/or injuries.

- Use personal protective equipment (such as gloves, working shoes, safety goggles, working clothes, etc.).
- Comply with the national laws and regulations regarding occupational health and safety and transport.
- Do not transport the hydraulic valve using components with low stability, e.g. valve solenoids, connectors or cables.

⚠ CAUTION

Sharp edges!

Danger of cut injuries!

- Wear suitable protective equipment for the transport of the hydraulic valve.

Further information regarding the transport is available from Bosch Rexroth, see ➔ Chapter 16.1 "List of addresses" on page 25.

6.2 Storing the hydraulic valve

Hydraulic valves can be stored for up to 12 months under the following conditions:

- Hold the storage temperature range as specified in the "data sheet".
- The relative air humidity must not exceed 65%.
- The storage rooms must provide 100% UV protection.
- The hydraulic valve must not be exposed to ozone.
- The storage facilities must be free from etching substances and gases.
- Do not store the hydraulic valve outdoors but in a well-ventilated room.
- Protect the hydraulic valve against humidity.
- Store the hydraulic valve protected against impacts and sliding and do not stack it.
- Protect the hydraulic valve from dust and dirt.
- All connections at the hydraulic valve must be closed with cap elements.

Procedure after the expiration of the maximum storage time of 12 months

1. ➔ Check the complete hydraulic valve for damage and corrosion prior to installation.

2. ➔ In a test run, check the hydraulic valve for correct function and leak-tightness.

After expiry of the maximum storage time, we recommend having the hydraulic valve checked by your competent Bosch Rexroth service. In case of questions regarding spare parts, please contact local Bosch Rexroth service responsible for your hydraulic valve.

After disassembly

If a dismantled hydraulic valve is to be stored, it has to be preserved for protection against corrosion for the duration of storage.

Bosch Rexroth recommends the following procedure:

1. ➤ Proceed as described in chapter 10.1 "Cleaning and care".

2. ➤ Pack the hydraulic valve with a desiccant air-tightly in corrosion protection film.

In each case, please observe any applicable provisions and laws regarding the handling of substances hazardous to water or to health.

7 Assembly

7.1 Changes at the surface protection of the hydraulic valve

⚠ WARNING

Explosion hazard due to modifications on the hydraulic valve!

In the event of changes to the surface protection of the hydraulic valve, the following points must be observed:

- The valve solenoid must not be painted or otherwise coated with non-conductive substances. This leads to a loss of the explosion protection.
- Painting of the hydraulic valve housing may only be applied according to the provisions of EN 80079-36, section 6.7; otherwise, explosion protection can no longer be ensured.

7.2 Before the assembly

⚠ CAUTION

High pressure!

Risk of injury!

- Carry out any work at the hydraulic valve only after the system has been depressurized.

⚠ WARNING

Explosion hazard due to wrong area of application!

A hydraulic valve which is not approved for the area of application can cause explosions!

- Please check if you have the right valve type by means of the type designation on the name plate of the hydraulic valve.
- Transport protection elements (e.g. cover plates, protective plugs) must be removed prior to use in an explosive atmosphere.

7.3 Required accessories

Valve mounting screws

The information regarding the valve mounting screws can be found in the "data sheet".

Subplates

The information regarding the subplates can be found in the "data sheet".

Ordering address for accessories and hydraulic valves

The address of our responsible sales organizations can be found on the Internet at www.boschrexroth.com and in the ➔ Chapter 16.1 "List of addresses" on page 25.

7.4 Assembling the valve

7.4.1 Installing the hydraulic valve in the system

1. ➔ Check the seal rings on all sealing surfaces for completeness and intactness. Other sealants are not admissible.
2. ➔ Place the hydraulic valve on the mounting surface.
3. ➔ Tighten all valve mounting screws. The following tightening torques apply to installation on cast iron or steel.

Type	Size	Tightening torque with admissible tolerance	Number of valve mounting screws
DBET..6X/...XE...	NG6	7 Nm ±10%	4

ⓘ If the hydraulic valve is to be mounted on mounting surfaces of a different material, it might be necessary to use a lower tightening torque in order to exclude any damage.

7.4.2 Establishing the electrical connection

⚠ WARNING

High electrical voltage!

Danger to life, risk of injury caused by electric shock due to incorrect connection and faulty pin assignment.

- Provide for proper, safe PE connection.
- Before switching on, check whether the protective grounding conductors at all electric devices are firmly connected according to the connection diagram.
- Close the terminal box according to the guidelines in these operating instructions.

⚠ WARNING	Explosion hazard due to missing equipotential bonding! Electrostatic processes, an incorrect grounding concept or missing equipotential bonding may lead to an explosion. Moreover, this can cause hydraulic malfunctions! <ul style="list-style-type: none"> – Provide for correct grounding and provide for proper equipotential bonding. – The base plate and/or subplate on which the hydraulic valve is fitted must be electrically conductive and included in the equipotential bonding according to EN 60079-14 and IEC 60364-4-41.
⚠ WARNING	Explosion hazard due to improper installation! No precautions are taken for safe connection of the shielding or sheathing in the terminal box of the solenoid coil and on the cable and line entry. The use of connection lines with shielding or sheathing can lead to potential backfeeding and is thus an explosion hazard! <ul style="list-style-type: none"> – Only use connection lines without shielding or sheathing.
⚠ CAUTION	Danger of damage to property and personal injuries! A faulty energy supply can lead to uncontrolled switching processes. These could result in possible malfunctions or failure of the hydraulic valve. <ul style="list-style-type: none"> – Only use a power supply unit with safe separation. – Always comply with the country-specific regulations.
⚠ CAUTION	Danger of short circuit due to missing seals and caps! Fluids may enter the hydraulic valve and cause a short-circuit. <ul style="list-style-type: none"> – Before commissioning, ensure that all seals and caps of the plug-in connections are leak-proof.
NOTICE	Risk of short-circuit! Condensed water can build up in the terminal box and cause a short-circuit! <ul style="list-style-type: none"> – Allow the hydraulic valve to acclimatize for a few hours before establishing the electrical connection.

- Only the cable and line entry included in the scope of delivery may be used.
- When selecting the connection line, please observe the requirements regarding the temperature rating and avoid contact of the connection line with the solenoid coil surface. For selection and installation, observe the requirements of EN 60079-14.
- Ensure that there are no bends in the connection line and braided wires to avoid short-circuits and interruptions.
- Only assemble the cable and line entries according to the assembly instructions. Before assembly, check whether the individual components of the cable and line entry are complete and that the sealing elements are undamaged.
- Use finely stranded conductors only if they have pressed-on wire end ferrules.
- Use only lines satisfying the requirements on the terminal areas of the connection terminals and the cable and line entry, refer to "data sheet".

- During installation, ensure that the sealing elements are correctly seated to warrant the leak-tightness of terminal box and cable and line entry.
- Route the connection line in a strain-relieved form. The first mounting point must be within 15 cm of the cable and line entry.
- The wires of the connection line are connected to the 2-pole operating voltage connection and to the connection for protective grounding conductor. Connect the separate equipotential bonding conductor to the connection for potential equalization conductor.

The connection of the solenoid coil is polarity-independent. With solenoid coils for connection to alternating voltage, a bridge rectifier is integrated in the solenoid coil.

 - Slide the clamping screw (1) and the rubber seal (2) with the guide socket (5) on the connection line. Guide them through the screw-in section (6).
 - Assemble the rubber seal (2), the guide socket (5) and the clamping screw (1) on the screw-in section (6). Tighten the clamping screw (hexagon SW 22) applying a tightening torque of 10 ± 1 Nm. When tightening the clamping screw (1), the screw-in section (6) must be held in place with an open-end wrench (SW 22). Assemble the two hexagon socket head cap screws (3) of the clamping brackets (4). The tightening torque must be adapted to the cable strength.
5. ➤ Guide the individual conductor into the connection terminal and screw this into place with the clamping screws.
Tightening torques for the clamping screws:
Table 2: Tightening torques

Operating voltage connection	0.4...0.5 Nm
Connection for protective grounding conductor	1.0...1.2 Nm
Connection for potential equalization conductor	3.5...4.5 Nm

ⓘ For the position of the clamping screws, see "data sheet" under chapter "Electrical connection".
6. ➤ Assemble the cover with the seal underneath. Tighten the mounting screws diagonally, one after the other. Tightening torque of the cover screws: $1 \dots 1.5$ Nm.
7. ➤ Connect external equipotential bonding.

8 Commissioning

⚠ WARNING

Faulty assembly!

If the hydraulic valve is not correctly mounted, persons might be injured and the hydraulic valve or system could be damaged when commissioning the hydraulic valve.

- The solenoid coil must only be started with connected protective grounding conductor and connection for potential equalization conductor.

In order to commission the hydraulic valve, proceed as described in the sections below:

Check electrical connections

- Check the inside of the terminal box for corrosion. In case of visible corrosion, do not install the hydraulic valve.
- The electrical connections in the terminal box must be checked for proper condition before re-commissioning or initial operation.
- Seals are subject to a natural process of aging and, for this reason, check seals for damage every time the terminal box is opened. If the seals are damaged, contact the Bosch Rexroth service, see ➔ Chapter 16 “Appendix” on page 25.

Bleeding the hydraulic system

Observe the operating instructions of the device and/or system into which the hydraulic valve is installed.

- Before the actual operation, switch the hydraulic valve several times with reduced pressure. As a result, residual air is forced out of the hydraulic valve.

9 Operation

9.1 General information

▲ WARNING	Explosion hazard caused by overheating! Loss of explosion protection due to overheating! <ul style="list-style-type: none">– In case of bank assembly, only one solenoid of all hydraulic valves may be energized at a time.
▲ WARNING	Explosion hazard by the ignition of dust accumulations! If the maximum dust thickness exceeds 5 mm there is an explosion hazard! <ul style="list-style-type: none">– Make sure that the maximum dust layer thickness is not exceeded.– Periodically remove any dust accumulations.

10 Maintenance and repair

10.1 Cleaning and care

NOTICE	Solvents and aggressive, highly inflammable cleaning agents! Aggressive cleaning agents may damage the seals and the surface of the hydraulic components and let the product age faster. <ul style="list-style-type: none">– Do not use solvents or aggressive, easily inflammable cleaning agents.
NOTICE	Water jet! A high-pressure washer's water pressure could damage the hydraulic system and the seals of hydraulic components. <ul style="list-style-type: none">– Do not use a high-pressure washer for cleaning.

- Close all openings with appropriate protective caps.
- Only clean hydraulic components using a damp, non-linting cloth. Only use water and, if necessary, a mild cleaning agent.
- Remove dust and dirt accumulations on the hydraulic valve at regular intervals.

10.2 Inspection and maintenance

The following inspection, testing and maintenance works are to be carried out regularly. The intervals for the same have to be selected in a way – also dependent on the operating conditions – that deficiencies that have to be anticipated are identified timely. The check must, however, at least be carried out every **three years from the date of manufacture of the hydraulic valve**. The date of manufacture of the hydraulic valve can be seen from the name plate.

1. ➤ De-energize and depressurize the relevant system part.
2. ➤ Check all external fittings for completeness and tight seat.
3. ➤ Check cable and line entry, external grounding connection and connection line for tight seat.
4. ➤ Check hydraulic valve for external leakage and replace seals, if required, see ➔ Chapter 10.3 “Repair” on page 22.
5. ➤ Open the terminal box and check all seals for damage. If the seals are damaged, contact the Bosch Rexroth service.
6. ➤ Check the inside of the terminal box for corrosion. Corrosion is an indication of leakage. In case of visible corrosion, remove the hydraulic valve and have it repaired.
7. ➤ Check the internal lines and braided wires of the solenoid coil for visible damage. In case of visible damage, remove the hydraulic valve and have it repaired.
8. ➤ Check all screws and connections for tight seat.
9. ➤ Check all connection lines for damage. Replace the connection line if there is any visible damage.
10. ➤ Re-assemble the cover of the terminal box with the seal beneath it. Tighten the mounting screws diagonally, one after the other. Tightening torque of the cover screws: 1...1.5 Nm.

10.3 Repair

▲ WARNING

Explosion hazard due to improper repair!

Improper repair will void the explosion protection!

- Defective seals may only be replaced by new interchangeable seals in original equipment quality.

The machine end-user can repair external leakage of the valve connection surface.
Other repair work must be carried out by Bosch Rexroth.

Rectifying leakage at the valve connection surface

1. ➤ Remove the hydraulic valve, see ➔ Chapter 11 “Disassembly and replacement” on page 23.
2. ➤ Replace the seals.

3. ➔ Assemble the hydraulic valve back to the mounting surface.

10.4 Spare parts

Seal kit for the valve connection surface

Table 3: Seal kit for the valve connection surface

Type	Spare part	Material number
DBET..6X/...XE...	FKM seal kit	R961000838

Ensure the suitability of the sealing materials for the hydraulic fluid used! See "data sheet".

The spare parts can be obtained at the address given in ➔ Chapter 16 "Appendix" on page 25.

11 Disassembly and replacement

⚠ CAUTION

Falling of an incompletely disassembled hydraulic valve!

An incompletely disassembled hydraulic valve may fall and cause injuries.

- During disassembly, secure the hydraulic valve against falling.

Have sufficiently dimensioned collecting containers, sufficient cleaning cloths and medium-binding materials ready in order to collect or bind leaking hydraulic fluid.

- 1.** ➔ De-energize and depressurize the relevant system part.
- 2.** ➔ Disconnect the electrical connections professionally.
- 3.** ➔ Remove the hydraulic valve mounting screws and remove the valve from the mounting surface.
- 4.** ➔ Close the valve connection surface.

When replacing the hydraulic valve, all further steps are analogous to the assembly.

12 Disposal

12.1 Environmental protection

Careless disposal of the product and the hydraulic fluid could lead to environmental pollution.

- Thus, dispose of the product and the hydraulic fluid in accordance with the currently applicable national regulations in your country.
- Dispose of hydraulic fluid residues according to the applicable safety data sheets for these hydraulic fluids.

12.2 Recycling

Due to the high metal share, hydraulic products can mostly be recycled.

13 Extension and modification

⚠ WARNING

Explosion hazard due to impermissible extension or modification!

Every non-permitted extension or modification will void the explosion protection.

- No extensions or modifications may be made which are not described in these operating instructions.

14 Troubleshooting

14.1 Fault table

The hydraulic valve is usually not sensitive to faults if the prescribed application conditions and hydraulic fluid quality are complied with.

Table 4: Fault table

Error	Possible cause(s)	Remedy
Product does not switch	Electrical connection interrupted, no current continuity	
	• Cable break	Replace connection line
	• Electrical defect in the solenoid coil	Remove product and have it repaired
	• No pressure at P	Check and/or reapply pressure at port P
	• Dirt between poppet and valve seat	Remove product and have it repaired
	• Valve does not react to actuation	Remove product and have it repaired
	• Pressure change at identical control	Check pressure at port T
	• Contact problems on the connection terminals	Check the mounting screws of the connection terminals and tighten using a manual torque wrench. Observe ➔ Chapter 7.4.2 “Establishing the electrical connection” on page 17.
External leakage	Seal defective	
	• Seal at the connection surface is defective	Removing the product and replacing the seals

Following faults due to contamination, it is – in addition to the repair – essential to check the oil quality and improve it, if necessary, by suitable measures such as flushing or the additional installation of filters.
