## Features

- Fixed pump with axial tapered piston rotary group of bent-axis design, for hydrostatic drives in an open circuit
- For use in mobile and stationary applications
- The flow is proportional to the drive speed and displacement
- The drive shaft bearings are designed for the bearing service life requirements usually encountered in these areas
- High power density
- Small dimensions
- High total efficiency
- Economical design
- One-piece tapered piston with piston rings for sealing

# Technical data

## Hydraulic fluid

Before starting project planning, please refer to our data sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable hydraulic fluids), RE 90222 (HFD hydraulic fluids) and RE 90223 (HFA, HFB, HFC hydraulic fluids) for detailed information regarding the choice of hydraulic fluid and application conditions.

The fixed pump A2FO is not suitable for operation with HFA hydraulic fluid. If HFB, HFC or HFD or environmentally acceptable hydraulic fluids are used, the limitations regarding technical data or other seals must be observed.

### Selection diagram

## Details regarding the choice of hydraulic fluid

The correct choice of hydraulic fluid requires knowledge of the operating temperature in relation to the ambient temperature: in an open circuit, the reservoir temperature.

The hydraulic fluid should be chosen so that the operating viscosity in the operating temperature range is within the optimum range ( $v_{opt}$  see shaded area of the selection diagram). We recommended that the higher viscosity class be selected in each case.

Example: At an ambient temperature of  $X^\circ\text{C}$ , an operating temperature of  $60^\circ\text{C}$  is set in the circuit. In the optimum operating viscosity range ( $v_{opt}$ , shaded area), this corresponds to the viscosity classes VG 46 or VG 68; to be selected: VG 68.

### Note

The case drain temperature, which is affected by pressure and speed, can be higher than the reservoir temperature. At no point of the component may the temperature be higher than  $115^\circ\text{C}$ . The temperature difference specified below is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, we recommend flushing the case at port U (sizes 250 to 1000).

## Viscosity and temperature of hydraulic fluid

	Viscosity [mm²/s]	Temperature	Comment
Transport and storage at ambient temperature		$T_{min} \geq -50^\circ\text{C}$ $T_{opt} = +5^\circ\text{C}$ to $+20^\circ\text{C}$	factory preservation: up to 12 months with standard, up to 24 months with long-term
(Cold) start-up <sup>1)</sup>	$\nu_{max} = 1600$	$T_{St} \geq -40^\circ\text{C}$	$t \leq 3$ min, without load ( $p \leq 50$ bar), $n \leq 1000$ rpm (for sizes 5 to 200), $n \leq 0.25 \cdot n_{nom}$ (for sizes 250 to 1000)
Permissible temperature difference		$\Delta T \leq 25$ K	between axial piston unit and hydraulic fluid
Warm-up phase	$\nu < 1600$ to 400	$T = -40^\circ\text{C}$ to $-25^\circ\text{C}$	at $p \leq 0.7 \cdot p_{nom}$ , $n \leq 0.5 \cdot n_{nom}$ and $t \leq 15$ min
Operating phase			
Temperature difference		$\Delta T = \text{approx. } 12$ K	between hydraulic fluid in the bearing and at port T.
Maximum temperature		$115^\circ\text{C}$ $103^\circ\text{C}$	in the bearing measured at port T
Continuous operation	$\nu = 400$ to 10 $\nu_{opt} = 36$ to 16	$T = -25^\circ\text{C}$ to $+90^\circ\text{C}$	measured at port T, no restriction within the permissible data
Short-term operation <sup>2)</sup>	$\nu_{min} \geq 7$	$T_{max} = +103^\circ\text{C}$	measured at port T, $t < 3$ min, $p < 0.3 \cdot p_{nom}$
FKM shaft seal <sup>1)</sup>		$T \leq +115^\circ\text{C}$	see page 5

1) At temperatures below  $-25^\circ\text{C}$ , an NBR shaft seal is required (permissible temperature range:  $-40^\circ\text{C}$  to  $+90^\circ\text{C}$ ).

2) Sizes 250 to 1000, please contact us.

# Technical data

## Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

To ensure the functional reliability of the axial piston unit, a gravimetric analysis of the hydraulic fluid is necessary to determine the amount of solid contaminant and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 is to be maintained.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

If the above classes cannot be achieved, please contact us.

## Shaft seal

### Permissible pressure loading

The service life of the shaft seal is influenced by the speed of the axial piston unit and the case drain pressure (case pressure). The mean differential pressure of 2 bar between the case and the ambient pressure may not be enduringly exceeded at normal operating temperature. For a higher differential pressure at reduced speed, see diagram. Momentary pressure spikes ( $t < 0.1$  s) of up to 10 bar are permitted. The service life of the shaft seal decreases with an increase in the frequency of pressure spikes.

The case pressure must be equal to or higher than the ambient pressure.

### Sizes 10 to 200

### Sizes 250 to 1000

The values are valid for an ambient pressure  $p_{abs} = 1$  bar.

### Temperature range

The FKM shaft seal may be used for case drain temperatures from -25 °C to +115 °C.

### Note

For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C).

State NBR shaft seal in plain text when ordering.

Please contact us.

### Direction of flow

Size 5

Nominal pressure  $p_{nom}$  \_\_\_\_\_ 315 bar absolute  
Maximum pressure  $p_{max}$  \_\_\_\_\_ 350 bar absolute  
Single operating period \_\_\_\_\_ 10 s  
Total operating period \_\_\_\_\_ 300 h

Sizes 10 to 200

Nominal pressure  $p_{nom}$  \_\_\_\_\_ 400 bar absolute  
Maximum pressure  $p_{max}$  \_\_\_\_\_ 450 bar absolute  
Single operating period \_\_\_\_\_ 10 s  
Total operating period \_\_\_\_\_ 300 h

Sizes 250 to 1000

Nominal pressure  $p_{nom}$  \_\_\_\_\_ 350 bar absolute  
Maximum pressure  $p_{max}$  \_\_\_\_\_ 400 bar absolute  
Single operating period \_\_\_\_\_ 10 s  
Total operating period \_\_\_\_\_ 300 h

Minimum pressure (high-pressure side) \_\_\_\_\_ 25 bar absolute

### Rate of pressure change $R_{A\ max}$

Without pressure-relief valve \_\_\_\_\_ 16000 bar/s

### Pressure at suction port S (inlet)

Minimum pressure  $p_{S\ min}$  \_\_\_\_\_ 0.8 bar absolute

Maximum pressure  $p_{S\ max}$  \_\_\_\_\_ 30 bar absolute

### Note

Values for other hydraulic fluids, please contact us.

## Definition

### Nominal pressure $p_{nom}$

The nominal pressure corresponds to the maximum design pressure.

### Maximum pressure $p_{max}$

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

### Minimum pressure (high-pressure side)

Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

### Minimum pressure (inlet)

Minimum pressure at suction port S (inlet) which is required in order to prevent damage to the axial piston unit. The minimum pressure is dependent on the speed of the axial piston unit (see diagram on page 7).

### Rate of pressure change $R_A$

Maximum permissible rate of pressure rise and reduction during a pressure change over the entire pressure range.

Total operating period =  $t_1 + t_2 + \dots + t_n$

- The values are valid:
  - at an absolute pressure  $p_{abs} = 1$  bar at suction port S
  - for the optimum viscosity range from  $\nu_{opt} = 16$  to  $36$  mm<sup>2</sup>/s
  - with hydraulic fluid based on mineral oils
- Maximum speed (limiting speed) with increased inlet pressure  $p_{abs}$  at suction port S, see adjacent diagram.
- Torque without radial force, with radial force see page 8
- Torque at  $\Delta p = 315$  bar

**Note**

Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, with respect to speed variation, reduced angular acceleration as a function of the frequency and the permissible start up angular acceleration (lower than the maximum angular acceleration) can be found in data sheet RE 90261.

1) With intermittent operation

2) Maximum permissible axial force during standstill or when the axial piston unit is operating in non-pressurized condition.

3) Conical shaft with threaded pin and woodruff key (DIN 6888)

4) Restricted technical data only for splined shaft

5) Please contact us.

6) When at a standstill or when axial piston unit operating in non-pressurized conditions. Higher forces are permissible when under pressure, please contact us.

### Note

Influence of the direction of the permissible axial force:

+F<sub>ax max</sub> = Increase in service life of bearings

-F<sub>ax max</sub> = Reduction in service life of bearings (avoid)

## Technical data

### Effect of radial force $F_q$ on the service life of bearings

By selecting a suitable direction of radial force  $F_q$ , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

NG	Toothed gear drive	V-belt output
	$\varphi_{opt}$	$\varphi_{opt}$
5 to 180	$\pm 70^\circ$	$\pm 45^\circ$
200 to 1000	$\pm 45^\circ$	$\pm 70^\circ$

### Determining the operating characteristics

$$\text{Flow} \quad q_v = \frac{V_g \cdot n \cdot \eta_v}{1000} \quad [\text{L/min}]$$

$$\text{Torque} \quad T = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}} \quad [\text{Nm}]$$

$$\text{Power} \quad P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p}{600 \cdot \eta_t} \quad [\text{kW}]$$

$V_g$  = Displacement per revolution in  $\text{cm}^3$

$\Delta p$  = Differential pressure in bar

$n$  = Speed in rpm

$\eta_v$  = Volumetric efficiency

$\eta_{mh}$  = Mechanical-hydraulic efficiency

$\eta_t$  = Total efficiency ( $\eta_t = \eta_v \cdot \eta_{mh}$ )

# Dimensions size 5

Illustration: cw direction of rotation (on version "ccw direction of rotation" the port plate is rotated through 180°)

The drawing consists of two parts: a side view on the left and a detail view on the right.

**Side View:** Shows a pump assembly with a vertical shaft and a horizontal port plate. The shaft has a diameter of  $\varnothing 400 - 0.089$ . The port plate is tilted at an angle of  $18^\circ 30'$ . Key dimensions include: 50<sup>1)</sup> (top left), 14 (top left), 131 (top), 41.5 (top), 183 (middle), 183 (middle), 102 (middle), 249 (middle), 35 (bottom), 47 (bottom), 156 (bottom), 485 (bottom), 507 (bottom), and 22 (bottom). The shaft is labeled "Flange ISO 3019-2". The port plate is labeled "U", "T<sub>1</sub>", and "T<sub>2</sub>". A dashed line indicates the "cw direction of rotation".

**Detail View:** Shows the port plate with a diameter of 465. It features a central hole with a diameter of 500 and a hole with a diameter of 450. The port plate has 8 holes with a diameter of 45° (360°). The detail view is labeled "Detail Y".

W90x3x28x9g

**P** Parallel keyed shaft  
DIN 6885, AS25x14x125

## Ports

Designation	Port for	Standard	Size <sup>3)</sup>	Maximum pressure [bar] <sup>4)</sup>	State <sup>8)</sup>
B (A)	Service line fastening thread B/A	SAE J518 <sup>6)</sup> DIN 13	2 in M20 x 2.5; 30 deep	400	
S	Suction line fastening thread	SAE J518 <sup>6)</sup> DIN 13	4 in M16 x 2; 24 deep	30	O
T <sub>1</sub>	Drain line	DIN 3852 <sup>7)</sup>	M42 x 2; 20 deep	3	O <sup>5)</sup>
T <sub>2</sub>	Drain line	DIN 3852 <sup>7)</sup>	M42 x 2; 20 deep	3	X <sup>5)</sup>
U	Bearing flushing	DIN 3852 <sup>7)</sup>	M18 x 1.5; 12 deep	3	X
M <sub>A</sub> , M <sub>B</sub>	Measuring operating pressure	DIN 3852 <sup>7)</sup>	M14 x 1.5; 12 deep	400	X
M <sub>S</sub>	Measuring suction pressure	DIN 3852 <sup>7)</sup>	M14 x 1.5; 12 deep	30	X

1) To shaft collar

2) Center bore according to DIN 332 (thread according to DIN 13)

3) Observe the general instructions on page 34 for the maximum tightening torques.

4) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

5) Depending on installation position, T<sub>1</sub> or T<sub>2</sub> must be connected (see also installation instructions on pages 32 and 33).

6) Only dimensions according to SAE J518, metric fastening thread is a deviation from standard.

7) The spot face can be deeper than specified in the appropriate standard.

8) O = Must be connected (plugged on delivery)

X = Plugged (in normal operation)

# Installation instructions

## General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

Particularly in the installation position "drive shaft upwards" filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The case drain fluid in the motor housing must be directed to the reservoir via the highest available drain port ( $T_1$ ,  $T_2$ ).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the minimum permissible case pressure of all connected units is not exceeded in any situation. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the suction and drain lines must flow into the reservoir below the minimum fluid level. The permissible suction height  $h_s$  results from the overall loss of pressure; it must not, however, be higher than  $h_{s\max} = 800\text{ mm}$ . The minimum suction pressure at port S must also not fall below 0.8 bar absolute during operation and during cold start.

## Installation position

See the following examples 1 to 8.

Further installation positions are possible upon request.

Recommended installation positions: 1 and 2.

### Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

Installation position	Air bleed	Filling
1	–	$T_1$
2	–	$T_2$
3	–	$T_1$
4	R (U)	$T_2$

# Installation instructions

## Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

Recommendation for installation position 8 (drive shaft upward): A check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the pump housing.

Installation position	Air bleed	Filling
5	L <sub>1</sub>	T <sub>1</sub> (L <sub>1</sub> )
6	L <sub>1</sub>	T <sub>2</sub> (L <sub>1</sub> )
7	L <sub>1</sub>	T <sub>1</sub> (L <sub>1</sub> )
8	R (U)	T <sub>2</sub> (L <sub>1</sub> )

**L<sub>1</sub>** Filling / air bleed

**R** Air bleed port

**U** Bearing flushing / air bleed port

**S** Suction port

**T<sub>1</sub>, T<sub>2</sub>** Drain port

**h<sub>t min</sub>** Minimum required immersion depth (200 mm)

**h<sub>min</sub>** Minimum required spacing to reservoir bottom (100 mm)

**SB** Baffle (baffle plate)

**h<sub>S max</sub>** Maximum permissible suction height (800 mm)

**a<sub>min</sub>** When designing the reservoir, ensure adequate space between the suction line and the drain line. This prevents the heated, return flow from being drawn directly back into the suction line.

# General instructions

- The pump A2FO is designed to be used in open circuits.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the axial piston unit. Take appropriate safety measures (e. g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
  - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
  - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to ISO 13849.
- A pressure-relief valve is to be fitted in the hydraulic system.
- The following tightening torques apply:
  - Fittings:
    - Observe the manufacturer's instructions regarding tightening torques of the fittings used.
  - Mounting bolts:
    - For mounting bolts with metric ISO thread according to DIN 13 or with thread according to ASME B1.1, we recommend checking the tightening torque in individual cases in accordance with VDI 2230.
  - Female threads in the axial piston unit:
    - The maximum permissible tightening torques  $M_{G \max}$  are maximum values for the female threads and must not be exceeded. For values, see the following table.
  - Threaded plugs:
    - For the metallic threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs  $M_V$  apply. For values, see the following table.

Ports		Maximum permissible tightening torque of the female threads $M_{G \max}$	Required tightening torque of the threaded plugs $M_V^{1)}$	WAF hexagon socket in the threaded plugs
Standard	Size of thread			
DIN 3852	M8 x 1	10 Nm	7 Nm	3 mm
	M10 x 1	30 Nm	15 Nm <sup>2)</sup>	5 mm
	M12 x 1.5	50 Nm	25 Nm <sup>2)</sup>	6 mm
	M14 x 1.5	80 Nm	35 Nm	6 mm
	M16 x 1.5	100 Nm	50 Nm	8 mm
	M18 x 1.5	140 Nm	60 Nm	8 mm
	M22 x 1.5	210 Nm	80 Nm	10 mm
	M33 x 2	540 Nm	225 Nm	17 mm
	M42 x 2	720 Nm	360 Nm	22 mm

1) The tightening torques apply for screws in the "dry" state as received on delivery and in the "lightly oiled" state for installation.

2) In the "lightly oiled" state, the  $M_V$  is reduced to 10 Nm for M10 x 1 and 17 Nm for M12 x 1.5.
