

# Axial piston variable motor A6VM series 71

**RE 91610**

Edition: 11.2018

Replaces: 09.2018

- ▶ All-purpose high pressure motor
- ▶ Sizes 60 to 280
- ▶ Nominal pressure 450 bar
- ▶ Maximum pressure 530 bar (sizes 60 to 215)
- ▶ Maximum pressure 500 bar (size 280)
- ▶ Open and closed circuits

## Features

- ▶ Robust motor with long service life
- ▶ Approved for very high rotational speeds
- ▶ High starting efficiency
- ▶ Excellent slow-running characteristics
- ▶ Large variety of controls
- ▶ High control range (can be swiveled to zero)
- ▶ High torque
- ▶ Optionally with flushing and boost-pressure valve mounted
- ▶ Optionally with mounted high-pressure counterbalance valve
- ▶ Bent-axis design

## Contents

Type code	2
Hydraulic fluids	6

● = Available    ○ = On request    - = Not available

**Notices**

- Note the project planning notes on page 87.

<sup>9)</sup> Specify the type code of sensor in accordance with data sheet 95135 (HDD), 95132 (DSM) or 95133 (DSA) and observe the requirements for the electronics.

## Hydraulic fluids

The A6VM variable motor is designed for operation with HLP mineral oil according to DIN 51524.

Application instructions and requirements for hydraulic fluid selection, behavior during operation as well as disposal and environmental protection should be taken from the following data sheets before the start of project planning:

- ▶ 90220: Hydraulic fluids based on mineral oils and related hydrocarbons
- ▶ 90221: Environmentally acceptable hydraulic fluids
- ▶ 90222: Fire-resistant, water-free hydraulic fluids (HFDR/HFDU)
- ▶ 90223: Fire-resistant, water-containing hydraulic fluids (HFC, HFB)
- ▶ 90225: Limited technical data for operation with water-free and water-containing fire-resistant hydraulic fluids (HFDR, HFDU, HFB, HFC).

### Selection of hydraulic fluid

Bosch Rexroth evaluates hydraulic fluids by means of the Fluid Rating according to data sheet 90235.

Hydraulic fluids which have been evaluated positively in the Fluid Rating are contained in the following data sheet:

- ▶ 90245: Bosch Rexroth Fluid Rating list for Rexroth hydraulic components (pumps and motors)

The hydraulic fluid should be selected so the operating viscosity in the operating temperature range is within the optimal range ( $v_{opt}$ ; see selection diagram).

### Notice

The axial piston unit is not suitable for operation with HFA hydraulic fluids. If HFB, HFC and HFD or environmentally acceptable hydraulic fluids are used, the limitations regarding technical data or other seals must be observed.

### Viscosity and temperature of hydraulic fluids

	Viscosity	Shaft seal	Temperature <sup>3)</sup>	Comment
Cold start	$v_{max} \leq 1600 \text{ mm}^2/\text{s}$	NBR <sup>2)</sup>	$\theta_{St} \geq -40 \text{ }^\circ\text{C}$	$t \leq 3 \text{ min}$ , without load ( $p \leq 50 \text{ bar}$ ), $n \leq 1000 \text{ min}^{-1}$ Permissible temperature difference between the axial piston unit and hydraulic fluid in the system maximum 25 K
		FKM	$\theta_{St} \geq -25 \text{ }^\circ\text{C}$	
Warm-up	$v = 1600 \dots 400 \text{ mm}^2/\text{s}$			$t \leq 15 \text{ min}$ , $p \leq 0.7 \times p_{nom}$ and $n \leq 0.5 \times n_{nom}$
Continuous operation	$v = 400 \dots 10 \text{ mm}^2/\text{s}^{1)}$	NBR <sup>2)</sup>	$\theta \leq +78 \text{ }^\circ\text{C}$	measured at port <b>T</b>
		FKM	$\theta \leq +103 \text{ }^\circ\text{C}$	
	$v_{opt} = 36 \dots 16 \text{ mm}^2/\text{s}$			Optimal operating viscosity and efficiency range
Short-term operation	$v_{min} = 10 \dots 7 \text{ mm}^2/\text{s}$	NBR <sup>2)</sup>	$\theta \leq +78 \text{ }^\circ\text{C}$	$t \leq 3 \text{ min}$ , $p \leq 0.3 \times p_{nom}$ , measured at port <b>T</b>
		FKM	$\theta \leq +103 \text{ }^\circ\text{C}$	

### ▼ Selection diagram

Maximum permissible viscosity for cold start

1) This corresponds, for example on VG 46, to a temperature range of +4  $^\circ\text{C}$  to +85  $^\circ\text{C}$  (see selection diagram)

2) Special version, please contact us

3) If the temperature at extreme operating parameters cannot be adhered to, please contact us.

### Hydraulic fluid filtration

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

A cleanliness level of at least 20/18/15 is to be maintained according to ISO 4406.

At a hydraulic fluid viscosity of less than 10 mm<sup>2</sup>/s (e.g. due to high temperatures during short-term operation) at the drain port, a min. cleanliness level of 19/17/14 as defined in ISO 4406 is required.

For example, the viscosity 10 mm<sup>2</sup>/s at:

- ▶ HLP 32 corresponds to a temperature of 73 °C
- ▶ HLP 46 corresponds to a temperature of 85 °C.

### Flow direction

Direction of rotation as viewed on drive shaft	
Clockwise	Counterclockwise
<b>A to B</b>	<b>B to A</b>

### Working pressure range

Pressure at working port A or B		Definition
Nominal pressure $p_{nom}$	450 bar	The nominal pressure corresponds to the maximum design pressure.
Maximum pressure $p_{max}$	500 bar	The maximum pressure is the maximum working pressure during a single operating period. The sum of single operating periods must not exceed the total operating period.
Maximum Single operating period	10 s	
Total operating period	300 h	
Maximum pressure $p_{max}$ (only valid for NG 60-215)	530 bar	Within the total operating period of 300 h, a maximum pressure of 500 bar to 530 bar is permissible for a limited period of 50 h.
Maximum Single operating period	10 s	
Total operating period	50 h	
Minimum pressure (high-pressure side)	25 bar	Minimum pressure at the high-pressure side ( <b>A</b> or <b>B</b> ) which is required to prevent damage to the axial piston unit.
Minimum pressure – pump operating mode (inlet)	see the diagram	To prevent damage to the axial piston motor in pump operating mode (change of the high-pressure side at constant direction of rotation, e.g. during brake applications) a minimum pressure has to be ensured at the working port (inlet). The minimum pressure depends on the rotational speed and displacement of the axial piston unit.
Summation pressure $p_{Su}$ (pressure <b>A</b> + pressure <b>B</b> )	700 bar	The summation pressure is the sum of the pressures at the working ports ( <b>A</b> and <b>B</b> ).
Rate of pressure change $R_{A\ max}$		Maximum permissible pressure build-up and reduction speed during a pressure change across the entire pressure range.
with built-in pressure relief valve	9000 bar/s	
without pressure relief valve	16000 bar/s	
Case pressure at port T		
Continuous differential pressure $\Delta p_{T\ cont}$	2 bar	Maximum, averaged differential pressure at the shaft seal (case to ambient pressure)
Maximum differential pressure $\Delta p_{T\ max}$	see the diagram	Permissible differential pressure at the shaft seal (case to ambient pressure)
Pressure peaks $p_{T\ peak}$	10 bar	$t < 0.1\ s$

▼ **Rate of pressure change  $R_{A \max}$**

▼ **Maximum differential pressure at the shaft seal**

▼ **Minimum pressure – pump operating mode (inlet)**

This diagram is valid only for the optimum viscosity range from  $\nu_{opt} = 36$  to  $16 \text{ mm}^2/\text{s}$ .

If the above mentioned conditions cannot be ensured, please contact us.

▼ **Pressure definition**

Total operating period =  $t_1 + t_2 + \dots + t_n$

**Notice**

- ▶ Working pressure range applies when using mineral oil-based hydraulic fluids. Please contact us for values for other hydraulic fluids.
- ▶ In addition to the hydraulic fluid and the temperature, the service life of the shaft seal is influenced by the rotational speed of the axial piston unit and the leakage pressure in the case.
- ▶ The service life of the shaft seal decreases with increasing frequency of pressure peaks and increasing mean differential pressure.
- ▶ The case pressure must be greater than the ambient pressure.

**Effect of case pressure on beginning of control**

An increase in case pressure affects the beginning of control of the variable motor when using the following control options:

HP, HA.T3: increase

DA: decrease

With the following settings, an increase in case pressure will have no effect on the beginning of control:

HA.R and HA.U, EP, HA

The factory setting of the beginning of control is made at  $p_{abs} = 2$  bar case pressure (sizes 60 to 215) resp.  $p_{abs} = 1$  bar case pressure (size 280).

## Technical data

Size		NG	60	85	115	150	170	215	280

## Speed range

The minimum rotational speed  $n_{\min}$  is not limited. For applications with requirements on the evenness of the rotation at low rotational speeds, please contact us.

### Notices

- Theoretical values, without efficiency and tolerances; values rounded
- Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. Other permissible limit values, such as speed variation, reduced angular acceleration as a function of the frequency and the permissible angular acceleration at start (lower than the maximum angular acceleration) can be found in data sheet 90261.

## ▼ Permissible displacement in relation to rotational speed

### Determining characteristics

Inlet flow	$q_v = \frac{V_g \times n}{1000 \times \eta_v}$	[l/min]
Rotational speed	$n = \frac{q_v \times 1000 \times \eta_v}{V_g}$	[rpm]
Torque	$M = \frac{V_g \times \Delta p \times \eta_{hm}}{20 \times \pi}$	[Nm]
Power	$P = \frac{2 \pi \times M \times n}{60000} = \frac{q_v \times \Delta p \times \eta_t}{600}$	[kW]

### Key

$V_g$	Displacement per revolution [cm <sup>3</sup> ]
$\Delta p$	Differential pressure [bar]
$n$	Rotational speed [rpm]
$\eta_v$	Volumetric efficiency
$\eta_{hm}$	Hydraulic-mechanical efficiency
$\eta_t$	Total efficiency ( $\eta_t = \eta_v \times \eta_{hm}$ )

- The values are valid:
  - for the optimum viscosity range from  $\nu_{\text{opt}} = 36$  to  $16$  mm<sup>2</sup>/s
  - with hydraulic fluid based on mineral oils
- Note input flow limitation due to counterbalance valve (page 74).
- Torque without radial force, with radial force see page 10.
- Values in this range on request

### Permissible radial and axial loading on the drive shafts

Size	NG	60	60	85	85	115	115	150	150	150

Permissible axial force per bar working pressure	$+ F_{ax \text{ perm/ bar}}$	N/ bar	15.1	15.1	17.0	17.0	19.4

### Effect of radial force $F_q$ on bearing service life

By selecting a suitable direction of radial force  $F_q$ , the load on the bearings, caused by the internal rotary group forces can be reduced, thus optimizing the service life of the bearings. Recommended position of mating gear is dependent on direction of rotation. Examples:

#### ▼ Gear output drive

- 1 "Counter-clockwise" rotation, pressure at port B
- 2 "Clockwise" rotation, pressure at port A
- 3 Bidirectional direction of rotation

### Notices

- The values given are maximum values and do not apply to continuous operation.
- The permissible axial force in direction  $-F_{ax}$  is to be avoided as the lifetime of the bearing is reduced.
- Special requirements apply in the case of belt drives. Please contact us.

1) Please contact us.

## HP – Proportional hydraulic control

The proportional hydraulic control provides infinite adjustment of the displacement. The control is proportional to the pilot pressure at port **X**.

### HP1, HP2 positive control

- ▶ Beginning of control at  $V_{g \min}$  (minimum torque, maximum permissible rotational speed at minimum pilot pressure)
- ▶ End of control at  $V_{g \max}$  (maximum torque, minimum rotational speed at maximum pilot pressure)

### HP5, HP6 negative control

- ▶ Beginning of control at  $V_{g \max}$  (maximum torque, minimum rotational speed at minimum pilot pressure)
- ▶ End of control at  $V_{g \min}$  (minimum torque, maximum permissible rotational speed, at maximum pilot pressure)

### Notice

- ▶ Maximum permissible pilot pressure:  $p_{st} = 100$  bar
- ▶ The control oil is internally taken out of the high-pressure passage of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Please keep in mind that pressures up to 530 bar (NG60 to 215) resp. 500 bar (NG280) can occur at port **G**.
- ▶ Please state the desired beginning of control in plain text when ordering, e.g.: beginning of control at 10 bar.
- ▶ The beginning of control and the HP characteristic curve are influenced by the case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 7) and thus a parallel displacement of the characteristic curve.
- ▶ A leakage flow of maximum 0.3 l/min can occur at port **X** due to internal leakage (working pressure > pilot pressure). The control is to be suitably configured to avoid an independent build-up of pilot pressure.

### Stroking time damping

The stroking time damping impacts the swivel behavior of the motor and consequently the machine response speed.

### Standard

HP without damping.

HP.D with throttle pin on both sides, symmetrical (see table), size 280 with orifice  $\varnothing 1.2$

### Optional

HP with throttle pin on both sides, symmetrical (see table), size 280 with nozzle  $\varnothing 1.2$

### ▼ Throttle pin overview

Size	60	85	115	150	170	215
Groove size [mm]	0.45	0.45	0.55	0.55	0.55	0.65

### HP1, HP5 pilot pressure increase $\Delta p_{st} = 10$ bar

#### HP1 positive control

A pilot pressure increase of 10 bar at port **X** results in an increase in displacement from  $V_{g \min}$  to  $V_{g \max}$ .

#### HP5 negative control

A pilot pressure increase of 10 bar at port **X** results in a decrease in displacement from  $V_{g \max}$  to  $V_{g \min}$ .

- ▶ Beginning of control, setting range 2 to 20 bar
- ▶ Standard setting:  
Beginning of control at 3 bar (end of control at 13 bar)

### ▼ Characteristic curve

**HP2, HP6 pilot pressure increase  $\Delta p_{St} = 25$  bar**

**HP2 positive control**

A pilot pressure increase of 25 bar at port **X** results in an increase in displacement from  $V_{g\ min}$  to  $V_{g\ max}$ .

**HP6 negative control**

A pilot pressure increase of 25 bar at port **X** results in a decrease in displacement from  $V_{g\ max}$  to  $V_{g\ min}$ .

- Beginning of control, setting range 5 to 35 bar
- Standard setting:  
Beginning of control at 10 bar (end of control at 35 bar)

▼ **Characteristic curve**

▼ **Circuit diagram HP1, HP2 size 60 to 215 (positive control)**

▼ **Circuit diagram HP1, HP2 size 280 (positive control)**

▼ **Circuit diagram HP5, HP6 size 60 to 215 (negative control)**

▼ Circuit diagram HP5, HP6 size 280 (negative control)

**HP5D1, HP6D1 Pressure control, fixed setting**

The pressure control overrides the HP control function. If the load torque or a reduction in motor swivel angle causes the system pressure to reach the setpoint value of the pressure control, the motor will swivel towards a larger displacement.

The increase in displacement and the resulting reduction in pressure cause the control deviation to decrease. With the increase in displacement the motor develops more torque, while the pressure remains constant.

Setting range of the pressure control valve 80 to 450 bar

▼ Circuit diagram HP5D1, HP6D1 size 280 (negative control)

## EP – Proportional control, electric

The proportional electric control provides infinite adjustment of the displacement. Control is proportional to the electric control current applied to the solenoid.

### EP1, EP2 positive control

- ▶ Beginning of control at  $V_{g \min}$  (minimum torque, maximum permissible rotational speed at minimum control current)
- ▶ End of control at  $V_{g \max}$  (maximum torque, minimum rotational speed at maximum control current)

### EP5, EP6 negative control

- ▶ Beginning of control at  $V_{g \max}$  (maximum torque, minimum rotational speed at minimum control current)
- ▶ End of control at  $V_{g \min}$  (minimum torque, maximum permissible rotational speed at maximum control current)

### ▼ Characteristic curve

### Notice

The control oil is internally taken out of the high-pressure passage of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us.

Please keep in mind that pressures up to 530 bar (NG60 to 215) resp. 500 bar (NG280) can occur at port **G**.

Size 280: The beginning of control and the EP characteristic curve are influenced by the case pressure.

### Stroking time damping

The stroking time damping impacts the swivel behavior of the motor and consequently the machine response speed.

### Standard

EP without damping.

EP.D with throttle pin on both sides, symmetrical (see table), size 280 with orifice Ø1.2

### Optional

EP with throttle pin on both sides, symmetrical (see table), size 280 with orifice Ø1.2

## HZ – Two-point control, hydraulic

The two-point hydraulic control allows the displacement to be set to either  $V_{g \min}$  or  $V_{g \max}$  by switching the pilot pressure at port **X** on or off.

### HZ5, HZ7 negative control

- Position at  $V_{g \max}$  (without pilot pressure, maximum torque, minimum rotational speed)
- Position at  $V_{g \min}$  (with pilot pressure > 15 bar activated, minimum torque, maximum permissible rotational speed)

#### ▼ Characteristic curve HZ5, HZ7

### Notice

- Maximum permissible pilot pressure: 100 bar
- The control oil is internally taken out of the high-pressure passage of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us. Please keep in mind that pressures up to 530 bar (NG60 to 215) resp. 500 bar (NG280) can occur at port **G**.
- A leakage flow of maximum 0.3 l/min occurs at port **X** (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure must be relieved from port **X** to the reservoir.

### Stroking time damping

The stroking time damping impacts the swivel behavior of the motor and consequently the machine response speed.

## EZ – Two-point control, electric

The two-point electric control, type EZ, allows the motor displacement to be set to either  $V_{g \min}$  or  $V_{g \max}$  by switching the electric current to a switching solenoid on or off.

### Notice

The control oil is internally taken out of the high-pressure passage of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us.

Please keep in mind that pressures up to 530 bar (NG60 to 215) resp. 500 bar (NG280) can occur at port **G**.

### Stroking time damping

The stroking time damping impacts the swivel behavior of the motor and consequently the machine response speed.

## HA – Automatic high-pressure related control

The automatic high-pressure related control adjusts the displacement automatically depending on the working pressure.

The displacement of the A6VM motor with HA control is  $V_{g \min}$  (maximum rotational speed and minimum torque). The control device measures internally the working pressure at **A** or **B** (no control line required) and upon reaching the set beginning of control, the controller swivels the motor with increasing working pressure from  $V_{g \min}$  to  $V_{g \max}$ . The displacement is modulated between  $V_{g \min}$  and  $V_{g \max}$  depending on the load.

### HA1, HA2 positive control

- ▶ Beginning of control at  $V_{g \min}$  (minimum torque, maximum rotational speed)
- ▶ End of control at  $V_{g \max}$  (maximum torque, minimum rotational speed)

### Notice

- ▶ For safety reasons, lifting winch drives are not permissible with beginning of control at  $V_{g \min}$  (standard for HA).
- ▶ The control oil is internally taken out of the high-pressure passage of the motor (**A** or **B**). For reliable control, a working pressure of at least 30 bar is necessary in **A** (**B**). If a control operation is performed at a working pressure < 30 bar, an auxiliary pressure of at least 30 bar must be applied at port **G** using an external check valve. For lower pressures, please contact us.  
Please keep in mind that pressures up to 530 bar (NG60 to 215) resp. 500 bar (NG280) can occur at port **G**.
- ▶ The beginning of control and the HA.T3 characteristic curve are influenced by case pressure. An increase in the case pressure causes an increase in the beginning of control (see page 7) and thus a parallel displacement of the characteristic curve.
- ▶ A leakage flow of maximum 0.3 l/min occurs at port **X** (working pressure > pilot pressure). To avoid a build-up of pilot pressure, pressure must be relieved from port **X** to the reservoir. **Only for HA.T control.**

### Stroking time damping

The stroking time damping impacts the swivel behavior of the motor and consequently the machine response speed.

### Standard for sizes 60 to 280

HA1,2 with one-sided throttle pin, throttling occurs from  $V_{g \min}$  to  $V_{g \max}$  (see table) HA3 and HA3T3 with BVI and throttle pin on both sides, 0.30, symmetrical

#### ▼ Throttle pin overview

▼ Circuit diagram HA2T3 size 280

### ▼ HA.U1, HA.U2 electric override, two-point

With the HA.U1 or HA.U2 control, the beginning of control can be overridden by an electric signal to a switching solenoid. When the override solenoid is energized, the variable motor swivels to maximum swivel angle, without intermediate position.

The beginning of control can be set between 80 and 300 bar (specify required setting in plain text when ordering).

Technical data, solenoid with $\varnothing 45$	U1	U2
Voltage	12 V ( $\pm 20\%$ )	24 V ( $\pm 20\%$ )
No override	de-energized	de-energized
Position $V_{g \max}$	energized	energized
Nominal resistance (at 20 °C)	4.8 $\Omega$	19.2 $\Omega$

### ▼ Circuit diagram HA1U1, HA1U2 size 60 to 215

### HA.R1, HA.R2 electric override, electric travel direction valve

With the HA.R1 or HA.R2 control, the beginning of control can be overridden by an electric signal to switching solenoid **b**. When the override solenoid is energized, the variable motor swivels to maximum swivel angle, without intermediate position.

The travel direction valve ensures that the preselected pressure side of the hydraulic motor (**A** or **B**) is always connected to the HA control, and thus determines the swivel angle, even if the high-pressure side changes (e.g. travel drive during a downhill operation). This thereby prevents undesired swiveling of the variable motor to a larger displacement (jerky deceleration and/or braking characteristics).

Depending on the direction of rotation (direction of travel), the travel direction valve is actuated through the compression spring or the switching solenoid **a** (see page 28).

### Electric override

Technical data, solenoid <b>b</b> with $\varnothing 45$	R1	R2

**DA – Automatic control, speed related**

The variable motor A6VM with automatic speed-related control is intended for use in hydrostatic travel drives in combination with the variable pump A4VG with DA control. A drive speed-related pilot pressure signal is generated by the A4VG variable pump, and that signal, together with the working pressure, regulates the swivel angle of the hydraulic motor.

Increasing drive speed, i.e. increasing pilot pressure, causes the motor to swivel to a smaller displacement (lower torque, higher rotational speed), depending on the working pressure.

If the working pressure exceeds the pressure command value of the controller, the variable motor swivels to a larger displacement (higher torque, lower rotational speed).

- ▶ Pressure ratio  $p_{St}/p_{HD} = 5/100$  (NG60 to 215)
- ▶ Pressure ratio  $p_{St}/p_{HD} = 3/100$  (NG280)

DA control is only suitable for certain types of travel drive systems and requires review of the motor and vehicle parameters to ensure that the motor is used correctly and that machine operation is safe and efficient. We recommend that all DA applications be reviewed by a Bosch Rexroth application engineer. Our Sales department will provide you detailed information.

**Notice**

The beginning of control and the DA characteristic curve are influenced by case pressure. An increase in the case pressure causes a decrease / reduction in the beginning of control (see page 8) and thus a parallel displacement of the characteristic curve.

**Stroking time damping**

The stroking time damping impacts the swivel behavior of the motor and consequently the machine response speed.

**Standard for sizes 60 to 280**

DA with throttle pin on one side, throttling occurs from  $V_{g\ min}$  to  $V_{g\ max}$ . (see table)

▼ **Throttle pin overview**

Size	60	85	115	150	170	215	280
Groove size [mm]	0.45	0.45	0.55	0.55	0.55	0.65	2×1.0

**DA0, DA7**

**Hydraulic travel direction valve, negative control**

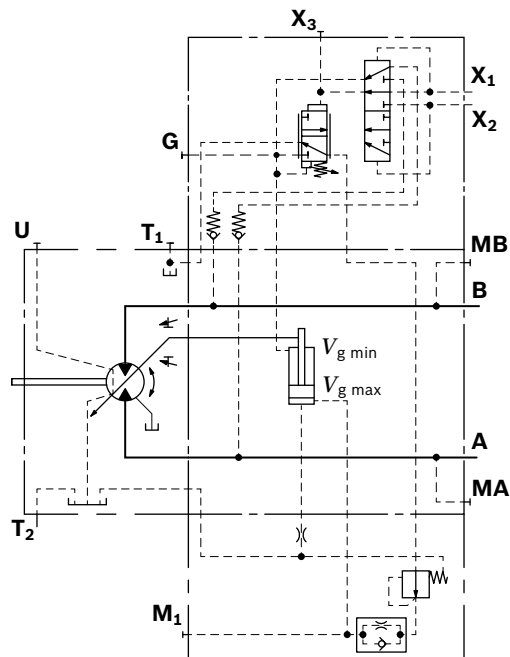

Dependent on the direction of rotation (travel direction), the travel direction valve is switched by using pilot pressure connections  $X_1$  or  $X_2$ .

Direction of rotation	Working pressure in	Pilot pressure in
Clockwise	A	$X_1$
Counterclockwise	B	$X_2$

▼ **Circuit diagram DA0 size 60 to 215**

▼ **Circuit diagram DA7 size 280**

**DA1, DA2 Electric travel direction valve + electric  $V_{g\ max}$  override, negative control**

Depending on the direction of rotation (direction of travel), the travel direction valve is actuated through the compression spring or the switching solenoid **a**.

When switching solenoid **b** is energized, the control can be overridden and the motor can be swiveled to maximum displacement (high torque, lower rotational speed) (electric  $V_{g\ max}$  override).

Travel direction valve, electric

Technical data, solenoid a with ø37		DA1	DA2
Voltage		12 V (±20%)	24 V (±20%)
Direction of rotation	Working pressure in		
	Counterclockwise	<b>B</b>	de-energized
	Clockwise	<b>A</b>	energized
Nominal resistance (at 20 °C)		5.5 Ω	21.7 Ω
Nominal power		26.2 W	26.5 W
Minimum active current required		1.32 A	0.67 A
Duty cycle		100%	100%
Type of protection: see connector version page 70			

Electric override

Technical data, solenoid b with ø37		R1	R2
Voltage		12 V (±20%)	24 V (±20%)
No override		de-energized	de-energized
Position $V_{g\ max}$		energized	energized
Nominal resistance (at 20 °C)		5.5 Ω	21.7 Ω
Nominal power		26.2 W	26.5 W
Minimum active current required		1.32 A	0.67 A
Duty cycle		100%	100%
Type of protection: see connector version page 70

## Electric travel direction valve (for DA, HA.R)

Application in travel drives in closed circuits. The travel direction valve of the motor is actuated by an electric signal that also switches the swivel direction of the travel drive pump (e.g. A4VG with DA control valve).

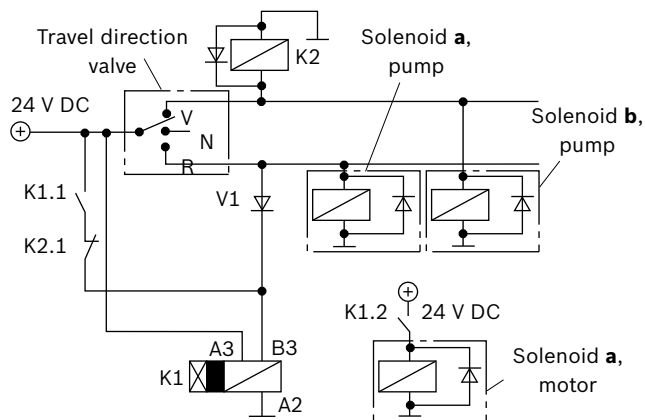

If the pump in the closed circuit is switched to the neutral position or into reverse, the vehicle may experience jerky deceleration or braking, depending on the vehicle weight and current travel speed.

When the travel direction valve of the pump (e.g. 4/3-way directional valve of the DA-control) is switched to

- ▶ the neutral position, the electric circuitry, which must be logically coordinated with the pump control system, causes the previous signal on the travel direction valve on the motor to be retained.
- ▶ Reversing, the electric circuitry causes the travel direction valve on the motor to switch to the other travel direction following a time delay (approx. 0.8 s) with respect to the pump.

As a result, jerky deceleration or braking is prevented in both cases.

### ▼ Circuit diagram, electric travel direction valve

### Notice

The shown diodes and relays are not included in the scope of delivery of the motor.

### Control DA1, DA

### ▼ Control, HA1R., HA2R.

Connector for solenoids

DEUTSCH DT04-2P-EP04

Molded, 2-pin, without bidirectional suppressor diode.  
There is the following type of protection with the mounted mating connector:

- ▶ IP67 (DIN/EN 60529) and
- ▶ IP69K (DIN 40050-9)

▼ Switching symbol

▼ Mating connector DEUTSCH DT06-2S-EP04

Consisting of	DT designation
1 housing	DT06-2S-EP04
1 wedge	W2S
2 sockets	0462-201-16141

The mating connector is not included in the scope of delivery.  
This can be supplied by Bosch Rexroth on request (material number R902601804).

Notice

- ▶ If necessary, you can change the position of the connector by turning the solenoid body.
- ▶ The procedure is defined in the instruction manual.

## Neutral position switch

The neutral position switch NLS electronically detects the neutral position of the A6VM, thereby ensuring the torque freedom of the motor. The use of the NLS in a transmission control provides a faster switching cycle in the drive. In addition, the switch reliability is improved and thereby the service life of the drive increased.

Type code, technical data, dimensions and details on the connector, plus safety instructions about the sensor can be found in the NLS data sheet 95152.

### Technical data

Type	NLS	
Recommended operating voltage	5 V	
Maximum voltage	not actuated	32 V
	actuated	11.5 V
Minimum permissible current	0 mA	
Maximum permissible current	10 mA	
Maximum switching cycle number	1 million	
Contact type	normally open contact (open in non-actuated state)	
Type of protection (with mating connector plugged)	IP67/IP69K	
Temperature range of sensor (medium and ambient temperature) <sup>1)</sup>	-40 °C ... 125 °C	
Temperature range of thread seal ring FKM <sup>1)</sup>	-15 °C ... 125 °C	
Pressure resistance	nominal	3 bar
	max. (momentary peaks)	10 bar <sup>2)</sup>

### Notice

The minimum swivel angle is dependent on the  $V_{g \text{ min-Stop}}$

### ▼ Mating connector

Consisting of	Material number
1 housing	282080
1 socket contact	282403-1

The mating connector is not included in the scope of delivery.

This mating connector can be ordered from AMP.

### ▼ Dimensions

Version "N" with neutral position switch mounted

Size	Adjustable angle		X [mm]		X1 [mm]
	min.	max.	at min angle	at max angle	
85	0°	2°	144.7	141.4	28.0
115	0°	4°	148.1	140.4	30.0
150	0°	1°	153.1	150.9	30.0
170	0°	0°		153.1	30.0
215	0°	0°		159.1	30.0

- 1) Observe the permissible temperature range of the axial piston motor.
- 2) Observe the permissible viscosity range of the axial piston motor. At oil viscosities >1800 mm<sup>2</sup>/s, the switch may be unintentionally actuated by case pressure peaks of >10 bar.

## Flushing and boost-pressure valve

The flushing and boost-pressure valve is used to remove heat from the hydraulic circuit.

In a closed circuit, it is used for flushing the case and safeguarding the minimum boost pressure.

Hydraulic fluid is directed from the respective low-pressure side into the motor housing. This is then fed into the reservoir, together with the leakage. In the closed circuit, the removed hydraulic fluid must be replaced by cooled hydraulic fluid supplied by the boost pump.

The valve is mounted on the port plate or integrated (depending on the control type and size).

### Cracking pressure of pressure retention valve

(observe when setting the primary valvee)

- ▶ Size 60 to 215, fixed setting 16 bar
- ▶ Size 280, adjustable 15 to 35 bar

### Switching pressure of flushing spool $\Delta p$

- ▶ Size 60 to 115 (small flushing valve)  $8 \pm 1$  bar
- ▶ Size 115 to 215 (medium and large flushing valve)  $17.5 \pm 1.5$  bar
- ▶ Size 280  $8 \pm 1$  bar

### Flushing flow $q_v$

Orifices can be used to adjust the flushing flows as required. The following parameters are based on:

$$\Delta p_{\text{ND}} = p_{\text{ND}} - p_{\text{G}} = 25 \text{ bar and } \nu = 10 \text{ mm}^2/\text{s}$$

( $p_{\text{ND}}$  = low pressure,  $p_{\text{G}}$  = case pressure)

## Notices

- ▶ Port **S<sub>a</sub>** only for sizes 150 to 280
- ▶ For a flushing flow of 35 l/min<sup>1)</sup> it is recommended that port **S<sub>a</sub>** be connected in order to prevent an increase in case pressure. An increased case pressure reduces the flushing flow.

## BVD and BVE counterbalance valve

### Function

Counterbalance valves for travel drives and winches should reduce the danger of overspeed and cavitation of axial piston motors in open circuits. Cavitation occurs if, during braking, when going downhill or during the load-lowering process, the motor speed is greater than it should be for the given inlet flow and thus the supply pressure falls sharply.

If the supply pressure falls below the level specified for the relevant counterbalance valve, the counterbalance valve spool moves into the closed position. The cross-sectional area of the counterbalance valve return passage is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor reaches the specified value for the given inlet flow.

### Notice

- ▶ BVD available for sizes 60 to 280 and BVE available for sizes 115 to 280.
- ▶ The counterbalance valve must be ordered additionally. We recommend ordering the counterbalance valve and the motor as a set.

Order example: A6VM085HA1T30004A/71MWV0N4S  
97W0-0 + BVD20F27S/41B-V03K16D0400S12

- ▶ For safety reasons, controls with beginning of control at  $V_{g \min}$  (e.g. HA) are not permissible for lifting winch drives!
- ▶ Counterbalance valves must be optimized during prototype commissioning to prevent unacceptable operating conditions, and compliance with the specification must be verified.
- ▶ The counterbalance valve does not replace the mechanical service brake and holding brake.
- ▶ Observe the detailed notes on the counterbalance valve in the data sheets 95522 (BVD), 95525 (BVE) and 95528 (BVD/BVE32)!
- ▶ For the design of the brake release valve, we must know the following data for the mechanical holding brake:
  - the cracking pressure
  - the volume of the brake spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
  - the required closing time for a warm device (oil viscosity approx. 15 mm<sup>2</sup>/s)

### Permissible inlet flow or pressure when using pressure relief valve and BVD/BVE

215		628					9				32 (BVD/BVE)	350/400	628
280	450/500	700											650

### Mounting the counterbalance valve

When delivered, the counterbalance valve is fastened to the motor with two tacking screws (transport lock). The tacking screws may not be removed while mounting the working lines. If the counterbalance valve and motor are delivered separately, the counterbalance valve must first be fastened to the motor port plate using the provided tacking screws.

The counterbalance valve is finally mounted to the motor by fitting the SAE flange.

The screws to be used and the instructions for mounting can be found in the instruction manual.

- 1) Pressure relief valve
- 2) Counterbalance valve, double-acting
- 3) Counterbalance valve, one-sided

- 1) At the mounting version for the controls HP5, HP6 and EP5, EP6, the cast-in port designations **A** and **B** on the counterbalance valve BVD do not correspond with the port designation of the A6VM motor.  
The designation of the ports on the installation drawing of the motor is binding!
- 2) For information on tightening torques, see the instruction manual.

- 3) Momentary pressure peaks can occur depending on application. Keep this in mind when selecting measuring devices and fittings.
- 4) The countersink may be deeper than specified in the standard.
- 5) O = Needs to be connected (comes plugged)  
X = Plugged (in normal operation)

## Integrated BVI counterbalance valve

### Function

The integrated counterbalance valves for track drives in crawler excavators should reduce the danger of overspeed and cavitation of axial piston motors in open circuits. Cavitation occurs if, during braking or driving downhill, the rotational speed of the motor is greater than it should be for the given inlet flow, causing the supply pressure to fall sharply.

If the supply pressure falls below the level specified for the relevant counterbalance valve, the counterbalance valve spool moves into the closed position. The cross-sectional area of the counterbalance valve return passage is then reduced, creating a bottleneck in the return flow of the hydraulic fluid. The pressure increases and brakes the motor until the rotational speed of the motor reaches the specified value for the given inlet flow.

### Notice

- ▶ BVI available for sizes 150 and 170.
- ▶ The counterbalance valve must be ordered additionally. Order example: A6VM150HP6000001A/71MWV0R4A 16Y0-0 + BVI540603002-0
- ▶ Counterbalance valves must be optimized during prototype commissioning to prevent unacceptable operating conditions, and compliance with the specification must be verified.
- ▶ The counterbalance valve does not replace the mechanical service brake and holding brake.
- ▶ For the design of the brake release valve, we require the following data for the mechanical holding brake:
  - the cracking pressure
  - the volume of the brake spool between minimum stroke (brake closed) and maximum stroke (brake released with 21 bar)
  - the required closing time for a warm device (oil viscosity approx. 15 mm<sup>2</sup>/s)

- 1) Only dimensions according to SAE J518, metric fastening thread is a deviation from the standard.  
2) The countersink may be deeper than specified in the standard.  
3) Momentary pressure peaks can occur depending on application. Keep this in mind when selecting measuring devices and fittings.

- 4) Depending on installation position, T<sub>1</sub> or T<sub>2</sub> must be connected (see also installation instructions on page 39).  
5) O = Needs to be connected (comes plugged)  
X = Plugged (in normal operation)

Speed sensor

Version A6VM...U (“prepared for speed sensor”, i.e. without sensor) is equipped with a spline on the rotary group.

A signal proportional to motor speed can be generated with the mounted speed sensor HDD/DSA/DSM. The HDD/DSA/DSM sensor measures the rotational speed and direction of rotation.

Type code, technical data, dimensions and parameters for the connector, plus safety instructions about the sensor can be found in the relevant data sheet 95132<sup>1)</sup> (DSM), 95133 (DSA) or 95135 (HDD).

The sensor is mounted on the port provided for this purpose with a mounting bolt. On deliveries without sensor, the port is plugged with a pressure-resistant cover.

We recommend ordering the A6VM variable motor complete with mounted sensor.

## Installation instructions

### General

The axial piston unit must be filled with hydraulic fluid and air-bled during commissioning and operation. This must also be observed following a longer standstill as the axial piston unit may empty via the hydraulic lines. Particularly in the installation position “drive shaft upwards”, filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The leakage in the housing area must be directed to the reservoir via the highest drain port (**T<sub>1</sub>**, **T<sub>2</sub>**).

If a shared drain line is used for several units, make sure that the respective case pressure in each unit is not exceeded. The shared drain line must be dimensioned to ensure that the maximum permissible case pressure of all connected units is not exceeded in any operational conditions, particularly at cold start. If this is not possible, separate drain line must be laid, if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the drain line must flow into the reservoir below the minimum fluid level.

### Notice

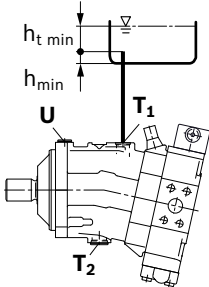

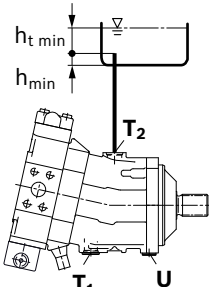

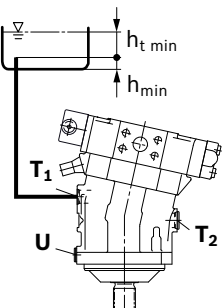

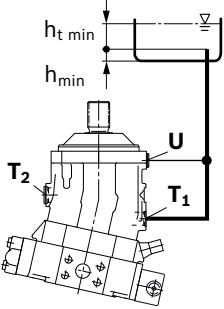

Effects on the control system are to be expected in certain installation positions. Gravity, dead weight and case pressure can cause minor characteristic shifts and changes in response time.

### Installation position

See the following examples **1** to **8**.  
Further installation positions are possible upon request.  
Recommended installation position: **1** and **2**

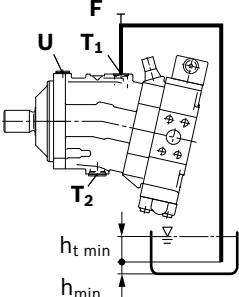

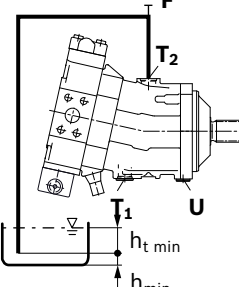

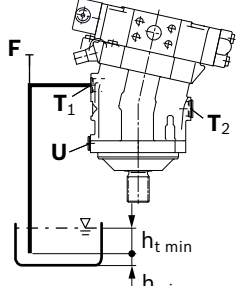

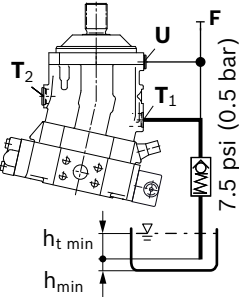

### Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir and below the min. fluid level of the reservoir.

Installation position	Air bleed	Filling
<b>1</b> 		<b>T<sub>1</sub></b>
<b>2</b> 		<b>T<sub>2</sub></b>
<b>3</b> 		<b>T<sub>1</sub></b>
<b>4</b> 	<b>U</b>	<b>T<sub>1</sub></b>

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir. Recommendation for installation position 8 (drive shaft up): A check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the housing area.

Installation position	Air bleed	Filling
5	U (F)	T <sub>1</sub> (F)
		
6	F	T <sub>2</sub> (F)
		
7	F	T <sub>1</sub> (F)
		
8	U	T <sub>1</sub> (F)
		

Key	
F	Filling/air bleeding
U	Bearing flushing port/air bleeding
T <sub>1</sub> , T <sub>2</sub>	Drain port
h <sub>t min</sub>	Minimum required immersion depth (200 mm)
h <sub>min</sub>	Minimum required distance to reservoir bottom (100 mm)

Notice

Port **F** is part of the external piping and must be provided on the customer side to make filling and air bleeding easier.

Project planning notes

- ▶ The motor A6VM is designed to be used in open and closed circuits.
- ▶ The project planning, installation and commissioning of the axial piston unit require the involvement of qualified skilled persons.
- ▶ Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, this can be requested from Bosch Rexroth.
- ▶ Before finalizing your design, please request a binding installation drawing.
- ▶ The specified data and notes contained herein must be observed.
- ▶ For safety reasons, controls with beginning of control at  $V_{g\ min}$  (e.g., HA) are not permissible for winch drives (e.g. anchor winches)!
- ▶ Depending on the operating conditions of the axial piston unit (working pressure, fluid temperature), the characteristic curve may shift.
- ▶ Preservation: Our axial piston units are supplied as standard with preservative protection for a maximum of 12 months. If longer preservation is required (maximum 24 months), please specify this in plain text when placing your order. The preservation periods apply under optimal storage conditions, which can be found in data sheet 90312 or in the instruction manual.
- ▶ Not all versions of the product are approved for use in safety functions according to ISO 13849. Please consult the responsible contact person at Bosch Rexroth if you require reliability parameters (e.g. MTTF<sub>D</sub>) for functional safety.

- ▶ Depending on the type of control used, electromagnetic effects can be produced when using solenoids. Applying a direct voltage signal (DC) to solenoids does not create electromagnetic interference (EMI) nor is the solenoid affected by EMI. Electromagnetic interference (EMI) potential exists when operating and controlling a solenoid with a modulated direct voltage signal (e.g. PWM signal). Appropriate testing and measures should be taken by the machine manufacturer to ensure other components or operators (e.g. with pacemaker) are not affected by this potential.
- ▶ Please note the details regarding the tightening torques of port threads and other threaded joints in the instruction manual.
- ▶ Working ports:
  - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
  - The working ports and function ports are only intended to accommodate hydraulic lines.

## Safety instructions

- ▶ During and shortly after operation, there is a risk of getting burnt on the axial piston unit and especially on the solenoids. Take the appropriate safety measures (e.g. by wearing protective clothing).
- ▶ Moving parts in control equipment (e.g. valve spools) can, under certain circumstances, get stuck in position as a result of contamination (e.g. contaminated hydraulic fluid, abrasion, or residual dirt from components). As a result, the hydraulic fluid flow and the build-up of torque in the axial piston unit can no longer respond correctly to the operator's specifications. Even the use of various filter elements (external or internal flow filtration) will not rule out a fault but merely reduce the risk. The machine/system manufacturer must test whether remedial measures are needed on the machine for the application concerned in order to bring the driven consumer into a safe position (e.g. safe stop) and ensure any measures are properly implemented.
- ▶ In certain conditions, moving parts in high pressure relief valves might get stuck in an undefined position due to contamination (e.g. contaminated hydraulic fluid). This can result in restriction or loss of load holding functions in lifting winches. Therefore it is the machine and/or system manufacturers responsibility to make sure that the load can always be put in a safe mode if needed. Also, he needs to ensure that these measures are properly implemented.
- ▶ When using the axial piston motor in winch drives, make certain that the technical limit values are not exceeded under all operating conditions. If the axial piston motor is extremely overloaded (e.g., if the maximum permissible rotational speeds are exceeded during weighing of the anchor while the ship is in motion), the rotary group may be damaged and, in the worst case, the axial piston motor may burst. The machine manufacturer/system manufacturer is to undertake additional measures, up to and including encapsulation.
